

Our final plan

Our Drainage and Wastewater Management Plan 2025-2050

Technical Appendices
Appendix K – Strategic Environmental Assessment
Report

May 2023

Preface

We're proud to present our first Drainage and Wastewater Management Plan (DWMP) and encouraged by the level of positive feedback we've received. Over the last four years, we've engaged and worked collaboratively with around 2,000 of our customers and stakeholders, to deepen our shared understanding and develop new ways to manage drainage and wastewater across our region. We illustrate our DWMP Cycle 1 and its headlines below.

We've progressed and enhanced our DWMP since we published it for public consultation in June 2022. We were pleased to receive lots of positive comments and support on the quality and ambition of our draft plan as well as useful ideas for making our final DWMP even stronger.

We've updated our draft plan based on our ongoing DWMP work, regulatory updates and our responses to the consultation feedback wherever possible*. Our updates include providing more detail where you felt it was needed and creating new appendices to answer technical queries. For more details on how we've progressed our final plan and responded to the consultation feedback, please see our [Non-technical summary](#) and [You said, We did Technical appendix](#).

* Some public consultation feedback didn't require further action or wasn't relevant to the DWMP process. Other feedback was relevant to future DWMP planning cycles and will be used to inform this work.

Progress signposts

We want to make it easy for you to see what's changed. You can spot all the places we've updated our draft plan with our 'progress signposts' which we've used across our final DWMP documents.

Here's where they'll be:

- Preface summaries – we've put a summary table in each document's preface (excluding Summary documents and CSPs)
- Relevant chapters – we've placed the appropriate signposts next to each relevant chapter (including Summary document and CSPs)

To help you find our progress signposts, here are examples of what to look out for:

Progress summary table

The progress signposts summary table for the chapters in this document is outlined below. We've used orange cells to indicate where our draft plan has been updated with progress.

Progress signposts summary: Technical Appendix K - SEA

Key DWMP content

This document specifically includes the following key DWMP content:

- Protecting the environment and providing a reliable, sustainable wastewater service:
 - Environmental assessments

Navigating our documents

To help you navigate around our final DWMP document suite and find where key DWMP content features, we've placed a Navigation index at the back of this document.

Thames Water Drainage and Wastewater Management Plan

Environmental Report

Thames Water

April 2023

Notice

This document and its contents have been prepared and are intended solely as information for Thames Water and use in relation to the TW Drainage and Wastewater Management Plan

Atkins Limited assumes no responsibility to any other party in respect of or arising out of or in connection with this document and/or its contents.

This document has 171 pages including the cover.

Executive Summary

Introduction

Thames Water, along with other water companies, are developing Drainage and Wastewater Management Plans (DWMPs) which will set out how they maintain, improve, and increase capacity of their drainage network and wastewater services over the next 25 years.

To do this, a series of solutions to known problems will need to be developed across the Thames Water area. It is recognised that some of these solutions may potentially cause adverse effects on the environment or the people of the area, particularly during their construction or implementation. However, all the solutions aim to address particular problems and will ultimately benefit both the environment and people.

Approach to the assessment

In order to understand where adverse effects may occur from constructing or implementing the proposed solutions, as well as where opportunities for environmental improvement may be found, an environmental assessment has been produced. The solutions analysed include more than forty generic types across all the drainage catchments in the Thames Water area (of which there are 382).

The environmental assessment process had a series of challenges. Key amongst these challenges is the fact that the DWMP is at an early stage of development, and it is not yet known precisely where the solutions may be developed, nor their precise size, layout or nature. This means that, at this stage, any approach to understanding the potential effects of solutions and their significance is necessarily high level.

Nevertheless, a Geographical Information System (GIS) was used to develop an approach that is consistent with environmental assessment guidance noted in the Framework for the production of DWMPs. This helped to demonstrate that the DWMP delivers the best, sustainable outcomes for customers, stakeholders and the environment.

This assessment reflects and builds upon earlier work undertaken as part of the Option Development and Appraisal Stage of the DWMP development.

Assessment findings

Uncertainties remain within the DWMP mainly in relation to where the solutions may be developed, or their precise size, layout or nature. However, based on the findings of the environmental assessment, it is possible to draw a number of key considerations in relation to the DWMP and the likely significant effects that can be anticipated from its implementation.

- Significant beneficial effects are likely across the majority of catchments.
- Significant beneficial effects identified are likely to be long term.
- Significant beneficial effects stem from solutions that will reduce frequency and severity of spills from the wastewater network (including combined sewer overflow events); reduce and improve resilience to flooding; improve quality of effluent discharges and improve capacity and efficiency of wastewater networks and processes.
- Beneficial effects are anticipated across a range of environmental topics such as biodiversity, water quality, flood risk, material assets, climate change and human health.
- Adverse effects are considered most likely in the construction phase, due to the construction / implementation activities required. These adverse effects are focused (though not limited to) a small range of environmental topics such as biodiversity, soils and landscape.

While some of the solutions are small in scale and will only require installation within existing infrastructure, or at discrete sites or properties, there is still a potential for these installation activities to cause disturbance to people or the environment. For the most part though, this is likely to be minimal and for a short period.

Other solution types are of a greater scale and will require construction activities – these could be of substantial scale on occasion and are much more likely to cause disturbance. This environmental assessment has identified where these activities have most potential for adverse effects and has begun the process of identifying ways in which negative effects can be minimised, as well as maximising any potential beneficial effects. It is also the case that for the most part, once construction is completed, environmental benefits will be

realised as water quality improves, there are less incidences of flooding and so on, and as such there will likely be positive effects on human health and wellbeing.

Conclusions and future development of the DWMP

A more detailed assessment of the issues identified within this assessment will be required as the DWMP is developed through future cycles, with this process continuing through the detailed design and solution implementation phases. While limitations in the assessment are highlighted, this work will provide the foundation for further, more detailed assessment, as the location and scale of interventions become known. In highlighting areas of potential risk and opportunity, as well as mitigation requirements, this assessment should provide a key resource to inform the design process, including site selection and scaling.

The first iteration of the Final Plan has been developed and identifies specific solutions for each catchment, London risk zone and existing Sewage Treatment Works (STW). Generally, the solutions presented in the Final Plan represent a subset of those previously briefed and assessed in earlier iterations of the DWMP development. The decision-making process that informed option selection for the first iterations of the DWMP included a range of economic, engineering and environmental metrics that included those anticipated Likely Significant Effects (LSEs).

Version 3 of this document replaces the 'Preferred Plan' chapter with a Chapter reflecting the 'Final Plan'. This chapter summarises the solutions and the associated LSEs of the Final Plan. While there will be further development of the DWMP in future iterations and further development of the solutions proposed, this assessment confirms the key early considerations in relation to the DWMP and the likely significant effects that can be anticipated from its implementation, which remain as presented above.

Stakeholder engagement

Discussions relating to this SEA and the Habitats Regulation Assessment (HRA) took place with the Environment Agency (EA) and Natural England. Section 2.1 of this report includes details of the issues raised by the EA and Natural England and how they have been addressed during the SEA process.

1. Introduction

Thames Water (TW), along with other water companies, are developing Drainage and Wastewater Management Plans (DWMPs) which will set out how they maintain, improve, and increase capacity of their drainage network and wastewater services over the next 25 years. As the Environment Agency (EA) note, for the first time, these plans will put the planning of drainage and wastewater services on a level footing with the planning undertaken for water resources¹. Final DWMPs have been produced to enable water companies to embed them within their respective PR24 business plans for Ofwat.

This Environmental Report (ER) sets out the key steps undertaken to examine options for addressing drainage issues brought forward through the Drainage and Wastewater Management Plan (DWMP) and determine their environmental significance. Results of this process were then used to inform further consideration of DWMP programme appraisal.

A key consideration at this stage of DWMP development is that while the catchments are known (over 310 have been examined following the Baseline Risk and Vulnerability Assessment (BRAVA)) and the broad option types (hereafter known as Generic Sub Options, or GSO's) are known (with a total of 43 possible GSO types set out), no further information or details regarding the precise location where a GSO may be developed within a catchment (other than those at an existing sewage works), nor the precise size, layout and nature of the GSO are known at this stage. This means that at this stage, any approach to understanding the potential effects of GSO's and their significance is necessarily high level.

Nevertheless, it has been possible to develop an approach that is consistent with environmental assessment guidance noted in the Framework for the production of DWMPs and as such, helps demonstrate that the DWMP delivers the best, sustainable outcomes for customers, stakeholders and the environment. It also demonstrates a comprehensive, evidence-based approach that can help to deliver resilience while protecting the environment. This assessment has been undertaken to reflect the requirements of Strategic Environmental Assessment (SEA) legislation and guidance, SEA methodologies, and also reflect and build upon earlier work undertaken as part of the Option Development and Appraisal Stage of the DWMP development.

2. Approach to Assessment

As noted, the approach taken to assess the DWMP is reflective of the requirements of SEA, which is set out in England through the Environmental Assessment of Plans and Programmes Regulations 2004 (the "SEA Regulations"). While the United Kingdom has now left the EU, the SEA Regulations still apply to a wide range of plans and programmes, including water and now wastewater plans, and modifications to them. While a formal SEA is not a statutory obligation for the DWMP at this level, integrating SEA principles at this stage will ensure that environmental considerations are made at the earliest stage of plan making.

The overarching objective of the SEA Regulations are:

"To provide for a high level of protection of the environment and to contribute to the integration of environmental considerations into the preparation and adoption of plans... with a view to promoting sustainable development, by ensuring that, in accordance with this Directive, an environmental assessment is carried out of certain plans... which are likely to have significant effects on the environment." (Set out in Article 1 of the EU SEA Directive)

The main requirements introduced by the SEA Regulations are that:

- the findings of the SEA are published in an Environmental Report (ER), which sets out the significant effects of the draft plan;
- consultation is undertaken on the plan and the ER;
- the results of consultation are taken into account in decision-making relating to the adoption of the plan; and
- information on how the results of the SEA have been taken into account is made available to the public.

¹EA: Pollution from water industry wastewater: challenges for the water environment (October 2021)

As requested by the Environment Agency, consideration was made of the approach to SEA made in respect of the National Flood and Coastal Erosion Risk Management Strategy (FCERM). While it is acknowledged that there are clear areas of relevance to the role of Thames Water and the DWMP specifically related to flood risk, the FCERM does not cover the full range of DWMP objectives nor the range of potential impacts and benefits of the options/solutions.

The FCERM strategy sets out a national framework for local flood and coastal erosion risk management strategies and projects. The assessment of the FCERM strategy was undertaken at what was considered to be proportionate to its national context, considering potential impacts at a national level. FCERM recognises that local level strategies and projects will have environmental effects at a local level, which can only be identified following environmental assessments. For example, the SEA of FCERM notes that the strategy contains no detailed locational information, or details of precise measures to be used. As a result, there was also uncertainty on the sensitivity of different places to new flood and coastal infrastructure or other risk management tools. The FCERM SEA notes that local level assessments will need to be undertaken at a more relevant scale to consider potential environmental effects in particular places.

At present, there is also a lack of specific knowledge of the type of measure / solution and its location where it would be developed under the DWMP. However, it was considered that utilising a GIS based approach to derive sensitivities across the approximate 300 catchments within the DWMP plan area, alongside knowledge of the 43 GSOs, meant that the DWMP could be examined at a more detailed level / 'greater granularity' than would be possible under the FCERM approach. This approach would allow the Plan making team access to more robust information on environmental issues across the Plan area. It would also ensure that more detailed environmental consideration could be made during Programme appraisal and identification of the preferred Plan. However, as with the FCERM, more detailed assessment is required, particularly in respect of those issues which can only be fully understood when locational and specific technological details are fully known.

2.1. Reporting and consultation

While the approach taken is not a formal SEA at this point, and no formal Scoping has been undertaken, this approach has benefited from consultation with the Environment Agency and Natural England. Consultation on the Preferred Plan was undertaken between 30 June 2022 and 26 September 2022 and an overview of the comments received and how these were addressed are set out as follows:

Table 2-1 Natural England

Consultation Comment	How was this addressed?
The SEA does not contain a full scoping report. Natural England acknowledges the suggestion to create a scope later on when there are more details available at a project level.	As noted in the SEA Report, no formal Scoping was undertaken. A review of relevant Plans and Policies, local and regional baseline information was carried out to ensure that the Assessment Framework was robust and reflective of local environmental issues. This approach was supplemented by a review of other regional reports including the Water Resources South East Scoping Report and benefitted from early discussions with the Environment Agency and Natural England regarding approach.
The current SEA does not give an indication of what the positive or negative impacts of specific options may be but rather summarises them in a table for each area.	Details of positive or negative effects of specific options are provided within the Impact Magnitude Proformas in Appendix C. It should be noted that these are necessarily high level assessments due to the uncertainty surrounding the precise location where options may be developed within a catchment, or the precise size, layout and nature of the option proposed.
Table 4-1 gives a description of each general sub option (GSO), allowing a more in-depth look at what the positive and negative impacts may be while allowing stakeholders to judge the suitability of options in specific areas. This table is useful for addressing different threats to habitats and species.	Noted.
In table 4-2 screening has been included which shows how the sensitivity has been concluded for the different SEA topics. However, the screening is lacking in detail to be sufficient for a full SEA. For example, the biodiversity topic describes European sites that are intersected by options as having the highest priority but there are no details on which European sites are likely to be impacted.	Noted – the lack of detail on which European Sites are likely to be impacted is due to the uncertainty surrounding precise location of Generic Sub Options. A post consultation meeting was held with Natural England and this issue was discussed in detail. Natural England have since confirmed that ‘due to the early stages in scheme planning, where many options have not been fully scoped, the information about the scale and nature of the schemes are not yet available to conduct in-depth analysis of environmental impacts. Thames Water’s approach seems proportionate, given the aforementioned and the large number of options included in the plan’.
Marine Conservation Zones, priority species and protected species have not been included in the SEA.	While these elements have now been incorporated into the baseline, therefore informing the wider assessment process it

Consultation Comment	How was this addressed?
	is important to note that the approach to the assessment is necessarily high level owing to the uncertainty of the location of options within catchments. As such, a set of rules (set out in Table 4-2) is used to establish an indicative and preliminary sensitivity characterisation for each catchment. In respect of biodiversity, this considers a range of international, national and locally designated sites for biodiversity as well as consideration of priority habitats. It is anticipated that the full range of designations pertinent to biodiversity will be appropriately considered when greater locational information is known, and project level assessments are undertaken.
For the water objective there should be a decision guiding question on whether there will be an effect on a European Site which is or will be subject to nutrient neutrality.	Noted – this will be included for the next iteration of the DWMP but has not been included here as due to the level of uncertainty regarding location etc., it would not be possible to assess this issue fully. A post consultation meeting held with Natural England confirmed that Natural England understand the issues of lack of locational information at this stage and have noted that the assessment took a precautionary approach.
Table 8-2 shows each GSO's attributed action against each SEA objective. While this does give an overview of how GSO's score against objectives this is not sufficient for an SEA. The SEA should demonstrate the effects of specific GSO's against the objectives with details of what positive and negative effects there may be. Potential mitigation methods should be proposed to offset negative impacts with a final severity level given for the construction and operational impacts	Details of positive or negative effects of specific options are provided within the Impact Magnitude Proformas in Appendix C and mitigation is proposed (see also Chapter 12). Note that these are necessarily high level assessments due to the uncertainty surrounding the precise location where options may be developed within a catchment, or the precise size, layout and nature of the option proposed.
A cumulative impacts assessment has been included but only at a generic high level. No cumulative impacts of GSO's have been discussed with the current data available As a full assessment has not been included, it is not appropriate to be concluding no major impact and excluding any SEA topics from the cumulative impact assessment. Natural England acknowledges that lacking the specific location of potential GSO's makes determining cumulative impact more difficult at this stage but there should be a list of other plans that could potentially have a cumulative impact with the DWMP options such as those	Note is made in relation to cumulative effects that there is a range of other water related Plans and Policies within the Plan Area e.g. Thames Water's Water Resource Management Plan and Drought plan, other water related Plans and Policies in neighbouring areas e.g. WRMPs, DWMPs or Drought plans in addition to Local Authority Development Plans related to residential, commercial and industrial development. For brevity purposes, these Plans were not specifically listed in Chapter 13 but are included in Appendix B.

Consultation Comment	How was this addressed?
proposed to local planning authorities, Strategic Resource Options (SRO) water transfers between regions and plans from neighbouring water companies.	Note is also made that there are a wide range of major developments or infrastructure projects underway or expected to commence within the Plan area, alongside more typical small scale 'day to day' developments. Specific examples include (but are not limited to) M25 RTMC Replacement, HS2, Crossrail, Lower Thames Crossing, as well as broader developments such as those through the Affordable Homes Programme, wider transport infrastructure, energy and utilities sectors. Generally, the schemes ultimately derived from the DWMP are likely to be located in relatively small discrete areas and not developed across wide areas, though this will be determined when the schemes are known. It is also the case that construction will take place at different times and within different catchments and as such the cumulative impact of construction activities will therefore be significantly reduced.
The SEA includes a section on monitoring, but this is not detailed enough for a full SEA. When data is not available to detail specific monitoring methodology then there should at least be high level aims for monitoring which covers limitations highlighted in the current baseline	Noted – Further information on proposed monitoring has now been identified and incorporated to the SEA Report (see Chapter 14). This notes that at this stage it is anticipated that likely monitoring metrics would include, as a minimum, those metrics currently utilised by Thames Water as part of their wastewater / drainage monitoring programme. Note has also been made of the proposed monitoring outlined in Thames Water's draft Water Resource Management Plan 2024, to ensure that there is synergy with that water management plan and that monitoring across environmental objectives is as effective as possible. As well as utilising existing and proposed Thames Water monitoring, some elements of the monitoring proposed will require liaison with bodies such as Historic England, Environment Agency, Natural England and Local Authorities and utilisation of data derived from their monitoring activities.
While avoidance measures should be taken to minimise impacts on protected sites avoidance is not a form of mitigation	Avoidance is recognised as meaning that mitigation will not be required, or its requirement will be reduced and would have a greater chance of success. It is the intention that the findings of

Consultation Comment	How was this addressed?
The SEA is not detailed enough in the conclusions drawn to accept or reject any of the GSO's discussed. Instead, it highlights what the positive or negative impacts may generally be along with their severity When more details are confirmed on specific locations of infrastructure needed the SEA will need to be updated	this assessment would be used as part of scheme development to help ensure that avoidance, particularly of protected sites, is a key consideration. A post consultation meeting held with Natural England confirmed that Natural England understand the issues of lack of locational information at this stage and have noted that the assessment took a precautionary approach.
The SEA shows how sensitivity of each area has been concluded, which looks at protected landscapes and what the proximity of the option is to that protected landscape. However, the SEA does not identify specific landscapes that are at risk and what the impacts might be from potential options. There is no mitigation proposed.	As noted, the assessments are necessarily high level assessments due to the uncertainty surrounding the precise location where options may be developed within a catchment, nor the precise size, layout and nature of the option proposed. A post consultation meeting held with Natural England confirmed that Natural England understand the issues of lack of locational information at this stage and have noted that the assessment took a precautionary approach.
The SEA shows how sensitivity of each area has been concluded by considering SSSIs and what the proximity of the option is to that SSSI. However, the SEA does not identify specific SSSIs that are at risk and what the impacts might be from potential options. There is no mitigation proposed.	As noted, the assessments are necessarily high level assessments due to the uncertainty surrounding the precise location where options may be developed within a catchment, nor the precise size, layout and nature of the option proposed. A post consultation meeting held with Natural England confirmed that Natural England understand the issues of lack of locational information at this stage and have noted that the assessment took a precautionary approach.

Table 2-2 - Environment Agency

Consultation Comment	How was this addressed?
The methodology adopted in the assessment was robust, involving consideration of potential catchment sensitivity and potential magnitude of impact utilising a GIS based approach which allowed for consistency of assessment. The report summarises the findings of the assessment although the detail is in appendices which are not easily accessible. This has limited our ability to review TWUL's SEA in greater detail. The Executive Summary was very dense reading and a nontechnical summary that is easily navigable by including sub-headings to show it clearly summarises the report would have been helpful.	Noted – All Appendices will be made available on publication of the Final DWMP. The assessment summary and conclusions are made in the Environmental Report. The Executive Summary has now been revised, with sub-headings added to provide greater clarity on findings.

Consultation Comment	How was this addressed?
The report was hard to navigate in places and the variation in terminology (i.e., referring to options that are proposed in the DWMP as ‘solutions’ in the early part of the report and then switching to the term ‘Generic Sub-options’) does mean the report is not always easy to follow.	Noted – greater clarification on terminology has been made in the Environmental Report and a Glossary updated to aid interpretation.
A scoping study was not undertaken. Restricted access to supporting details was limiting in terms of being able to understand what assumptions had been made in the assessment. Providing the additional volumes of this report on the Thames Water website to accompany the report so that the full details of the process adopted and the information and assumptions which underpins the findings can be understood would be helpful. Whilst this is stated as not being a statutory SEA it would be reasonably expected that, at a minimum, appendices setting out the list of plans, programmes and policies which were reviewed and details of the baseline and key environmental issues would be included in the report.	As noted in the SEA Report, no formal Scoping was undertaken, rather a review of relevant Plans and Policies, along with a review of local and regional baseline information was carried out to ensure that the Assessment Framework was robust and reflective of local environmental issues. This approach was also supplemented by a review of other regional reports including the Water Resources South East Scoping Report and benefitted from early discussions with Environment Agency and Natural England regarding approach. The Appendices documents will be made available on publication of the Final DWMP. For clarity, the Appendices include the following: Volume 2 Appendix A. Baseline and Key Environmental Issues Appendix B. Legislation, Plans and Programmes Appendix C. Impact Magnitude Proformas Appendix D. Solution Significance of Effect – All Catchments (excluding London Catchments, LRZs and existing STWs) Appendix E. Solution Significance of Effect –London Catchments and LRZs Appendix F. Solution Significance of Effect –Existing Sewage Treatment Works Volume 3 Appendix G. All Catchments (excluding London Catchments, LRZ and existing STWs) Proformas Volume 4 Appendix H. London Catchment and London Risk Zones Proformas Volume 5

Consultation Comment	How was this addressed?
Section 1 -p11 states “A key consideration at this stage of DWMP development is that while the catchments are known (we have assessed all catchments for which feasible options were identified as required) and the broad Solution types are known (with 43 possible Solution types selected for feasible optioneering out of a total of 47 considered for the unconstrained option development), no further information or details regarding the precise location where a Solution may be developed within a catchment (other than those at an existing sewage works), nor the precise size, layout and nature of the Solution are known at this stage. This means that at this stage, any approach to understanding the potential effects of Solutions and their significance is necessarily high level.” No proposals for monitoring are provided so it is not transparent as to the next steps in terms of what further investigation/modelling/assessment will be needed and the timescale. It is also not clear how consultation responses will be considered in finalising the DWMP.	Appendix I. Existing STW Proformas Noted – Further information on proposed monitoring has now been identified and incorporated into the SEA Report (see Chapter 14). This notes that at this stage it is anticipated that likely monitoring metrics would include, as a minimum, those metrics currently utilised by Thames Water as part of their wastewater / drainage monitoring programme. Note has also been made of the proposed monitoring outlined in Thames Water’s draft Water Resource Management Plan 2024, to ensure that there is synergy with that water management plan and ensure that monitoring across environmental objectives is as effective as possible. As well as utilising existing and proposed Thames Water monitoring, some elements of the monitoring proposed will require liaison with bodies such as Historic England, Environment Agency, Natural England and Local Authorities and utilisation of data derived from their monitoring activities.
We welcome the inclusion of information on groundwater protection and how it should be incorporated in the DWMP within the SEA. However currently none of the aspects relating to groundwater protection are addressed within the DWMP. Further work needed between now and publication to incorporate the guidance held within the SEA. The contents of the SEA should not be dealt with in isolation, it should be used. We are happy to provide further detail on specific detail within the SEA on groundwater which we believe should be mirrored directly in your DWMP.	A further Technical Appendix has been prepared in response to the consultation feedback regarding groundwater protection – see Technical Appendix T Groundwater Quality

Key reporting requirements are consistent with those set by the SEA Directive and SEA Regulations:

'An Environmental Report shall be prepared in which the likely significant effects on the environment of implementing the plan or programme, and reasonable alternatives taking into account the objectives and the geographical scope of the plan or programme, are identified, described and evaluated.'

This Assessment Report sets out anticipated likely significant effects of the DWMP, though it is to be stressed that this understanding of significance of effect is uncertain at this point due to the lack of knowledge of precise spatial location, or precise technical details, of the GSO's at this point.

In order to demonstrate how the approach taken is aligned to SEA, Table 2-3 sets out the way requirements of SEA have been addressed in this report.

Table 2-3 - Schedule of SEA Requirements

Information to be included in the Environmental Report under the SEA Regulations (Regulation 12 and Schedule 2)		Where covered in this Assessment Report
1.	An outline of the contents, main objectives of the plan, and of its relationship with other relevant plans and programmes	Chapters 1, 2 and 5 of Volume 1 (Environmental Report). See also Volume 2, (Appendix B).
2.	The relevant aspects of the current state of the environment and the likely evolution thereof without implementation of the plan;	Chapter 6 of Volume 1 (Environmental Report). See also Volume 2 (Appendix A) and Catchment Sensitivity Proformas contained in Volumes 3, 4 and 5.
3.	The environmental characteristics of areas likely to be significantly affected	Chapter 6 of Volume 1 (Environmental Report). See also Volume 2 (Appendix A) and Catchment Sensitivity Proformas contained in Volumes 3, 4 and 5.
4.	Any existing environmental problems which are relevant to the plan, including in particular, those relating to any areas of a particular environmental importance, such as areas designated pursuant to Directives 79/409/EEC and 92/43/EEC;	Chapter 6 of Volume 1 (Environmental Report).
5.	The environmental protection objectives, established at international, Community or Member State level, which are relevant to the plan and the way those objectives and any environmental considerations have been taken into account during its preparation	Chapters 4 and 7 of Volume 1 (Environmental Report)
6.	The likely significant effects on the environment, including short, medium and long-term effects, permanent and temporary effects, positive and negative effects, and secondary, cumulative and synergistic effects, on issues such as: biodiversity; population; human health; fauna; flora; soil; water; air; climatic factors; material assets; cultural heritage including architectural and archaeological heritage; landscape; the interrelationship between the above factors	Chapters 10 and 12 of Volume 1 (Environmental Report). See also Volume 2 (Appendix D)
7.	The measures envisaged to prevent, reduce and as fully as possible offset any significant adverse effects on the environment of implementing the plan	Chapters 10 and 11 of Volume 1 (Environmental Report). See also Volume 2 (Appendix C)
8.	An outline of the reasons for selecting the alternatives dealt with, and a description of how the assessment was undertaken including any difficulties (such as technical deficiencies or lack of know-how) encountered in compiling the required information	Chapters 2 and 4 of Volume 1 (Environmental Report) Any difficulties: Chapter 2 of Volume 1 (Environmental Report) – a key issue is the lack of precise spatial data of where GSO's will

Information to be included in the Environmental Report under the SEA Regulations (Regulation 12 and Schedule 2)	Where covered in this Assessment Report
	be implemented within a Catchment, as well as precise details of the scale and nature of the GSO. It is considered that within this Environmental Report a large number of alternative options have been embedded as part of the assessment. Not all GSO's have been taken forward as part of the Final Plan due to consideration of the results of this assessment process and other technical and economic considerations.
9. A description of measures envisaged concerning monitoring in accordance with Regulation 17	Chapter 13 of Volume 1 (Environmental Report). Also consult separate Habitats Regulations Assessment undertaken.

3. Description and Scope of the DWMP and environmental assessment

The section describes the context of the DWMP, as well as the spatial, temporal and technical scope of the DWMP.

3.1. Background and description of the DWMP

In 2018, Water UK collaborated with water companies across the UK, plus the Department for Environment, Food & Rural Affairs (Defra); the Welsh Government; Ofwat; the Environment Agency; Natural Resources Wales; the Consumer Council for Water; ADEPT; and Blueprint for Water to create a DWMP Framework². The document outlines a framework for undertaking drainage and wastewater management plans.

A DWMP will set out how water and wastewater companies intend to extend, improve and maintain a robust and resilient drainage and wastewater system. The plan must take a long-term view, setting out a planning period that is appropriate to the risks faced by each company, but with a minimum period of 25 years.

The ten England and Wales water and wastewater companies, including Thames Water, that are subject to regulatory price controls, have committed to produce DWMPs in accordance with this framework. The DWMPs will inform their business plan submissions for the next price review in 2024.

The framework provides the basis for more collaborative and integrated planning with and alongside organisations that have responsibilities relating to drainage, flooding and protection of the environment.

The Thames Water DWMP will be required to:

- Set out the company's assessment of long-term drainage and wastewater capacity and the drivers, risks and scenarios being planned for;
- Assess where (largely drainage) infrastructure managed by other stakeholders may impose additional risks to drainage and wastewater services; and
- Identify those options that offer best value to customers and the environment, ensuring robust, resilient and sustainable drainage and wastewater services in the long-term.

² <https://www.water.org.uk/wp-content/uploads/2018/12/Water-UK-DWMP-Framework-Report-Main-Document.pdf>

Figure 3-1 provides a schematic of the DWMP process steps that TW worked through to prepare the DWMP including:

1. Scope and Context: An overview of the drainage and wastewater region, plus the drivers and objectives that shaped the DWMP;
2. Catchment Screening: An overview of the region's results from the industry-wide catchment vulnerability screening against 17 different risk indicators;
3. Catchment risk analysis/Baseline Risk and Vulnerability Assessment (BRAVA): A more detailed assessment of the catchments to help understand the risks they face and identify opportunities for Options;
4. Option Development and Appraisal (ODA): A list of options considered and their feasibility, using a methodology which focuses the level of planning effort i.e. proportionate to the risk identified.
5. Programme Appraisal / Final DWMP.

Figure 3-1 - Schematic of DWMP Process Step

Source: A Framework for the production of Drainage and Wastewater Management Plans, September 2018

3.2. Geographic and Temporal Scope of DWMP

In reference to generating the 'Plan Area', Thames Water are responsible for over 300 drainage and wastewater catchments across England, concentrated in the South East (as shown in Figure 3-2), for which improvement works are proposed as part of this Plan. Given the occasionally discrete and spatially isolated nature of some of the catchments, this assessment considers the Local Authorities within which catchments exist. The outer boundaries of each of these Local Authorities are then merged and, for the purpose of this assessment, taken to represent the Plan Area. This allows for a more complete geographic reach (reflecting the potential for indirect effects of the Plan), a more thorough identification of environmental baseline and ultimately, a more robust assessment. The following Local Authorities have been identified as containing one or more Thames Water drainage and wastewater catchments;

- Swindon
- North Hertfordshire
- Horsham

- Luton
- Bracknell Forest
- West Berkshire
- Reading
- Slough
- Windsor and Maidenhead
- Wokingham
- Wiltshire
- Central Bedfordshire
- Aylesbury Vale
- Chiltern
- South Bucks
- Wycombe
- Brentwood
- Epping Forest
- Harlow
- Uttlesford
- Cotswold
- Basingstoke and Deane
- East Hampshire
- Hart
- Rushmoor
- Broxbourne
- Dacorum
- Hertsmere
- Three Rivers
- Watford
- Dartford
- Sevenoaks
- Daventry
- South Northamptonshire
- Cherwell
- Oxford
- South Oxfordshire
- Vale of White Horse
- West Oxfordshire
- Elmbridge
- Epsom and Ewell
- Guildford
- Mole Valley
- Reigate and Banstead
- Runnymede
- Spelthorne
- Surrey Heath
- Tandridge
- Waverley
- Woking
- Stratford-on-Avon
- Chichester
- Crawley
- Mid Sussex
- St Albans
- Welwyn Hatfield
- East Hertfordshire
- Stevenage
- City of London
- Barking and Dagenham
- Barnet
- Bexley
- Brent
- Bromley
- Camden
- Croydon
- Ealing
- Enfield
- Greenwich
- Hackney
- Hammersmith and Fulham
- Haringey
- Harrow
- Havering
- Hillingdon
- Hounslow
- Islington

Figure 3-2 - Plan Area

Source: <https://www.thameswater.co.uk/wholesale/who-we-are>

The Plan Area covers much of the South East of England and includes the population centres of London, Oxford and Guildford. It is important to recognise that the implementation of the DWMP may have beneficial and/or adverse effects outside the immediate boundary of the drainage and wastewater catchments. While this is addressed by the consideration of wider Local Authority boundaries in generating the Plan Area, it is possible that hydrological connections for example, act to extend effects beyond the Plan Area.

3.3. Technical Scope

The SEA Directive and the SEA regulations require that the likely significant effects on the environment are assessed, considering the following factors and interrelationship between them:

- Biodiversity;
- Population;
- Human health (covering noise issues among other effects on local communities and public health);
- Fauna and flora;
- Soil;
- Water;
- Air;
- Noise;
- Climatic factors;
- Material assets (covering infrastructure, waste and other assets);
- Cultural heritage, including architectural and archaeological heritage; and
- Landscape.

While not a formal SEA, this approach considers the above topics in the assessment of the DWMP.

3.4. Assessment of Alternatives

In development of the Final Plan, TW have defined fourteen value criteria, representing twelve planning objectives. These criteria include cost, reducing internal and external property flooding, reducing surface water runoff, storm overflow performance and environmental impact (positive and negative). The environmental significance of effect data presented in this Environmental Report for each of the over 300 catchments and specific solutions set out for each catchment (in excess of 40 GSOs) briefed have been fully integrated into the ODA process and into over fifty possible scenarios considered during Programme Appraisal.

Options developed during the ODA stage (See Appendix D of the DWMP 2025-2050 Option Development and Appraisal) have been compared, evaluated and combined, to create different possible investment plans (option portfolios, or 'programmes') that achieve planning objective targets. Costs and benefits associated with each potential plan have then been appraised, using techniques such as pareto curves showing the highest overall plan scores for the least cost, to determine whether they offer 'best value' to TW customers, the communities TW serve, and the natural environment in the TW region. This approach and assessment findings are detailed in Appendix E of the DWMP 2025-2050 (Programme Appraisal).

The PA process has determined the Final Plan and reported its environmental performance against alternative scenarios using a range of mechanisms such as radar plots. Of note, environmental, natural capital and wellbeing relative outcomes are high or comparable for the Final Plan compared to the other Plans. While negative impacts on the environment and natural capital appear worse, these are generally related to construction activities only. The PA concludes that the Final Plan is considered to provide the best value as it meets environmental and property flooding reduction targets, while providing high performance outcomes for environmental, natural capital and wellbeing. Details of the performance of the Final Plan in terms of significance of environmental effect are set out in Chapter 11.

3.5. Habitat Regulation Assessment (HRA)

Habitats Regulation Assessment (HRA) is required by the Conservation of Habitats and Species Regulations 2017 (SI No. 2017/1012, as amended by The Conservation of Habitats and Species (Amendment) (EU Exit) Regulations 2019 (SI 2019/579)) for all plans and projects which may have likely significant effects on a

European site and are not directly connected with or necessary to the management of the European site. The DWMP itself is not directly connected with, or necessary to, the nature conservation management of any European sites.

European sites include Special Areas of Conservation (SAC) and Special Protection Areas (SPA). As a matter of UK Government policy, potential SPAs (pSPA), possible SACs (pSAC), listed or proposed Wetlands of international importance (Ramsar sites) and sites identified, or required, as compensatory measures for adverse effects on European sites, pSPA, pSAC, and listed or proposed Ramsar sites, are included for the purposes of considering plans and projects which may affect them.. Hereafter all of the above designated nature conservation sites are referred to as 'European sites'.

There are four stages to the HRA process. These are summarised below:

- Stage 1 – Screening: To test whether a plan or project, either alone or in combination with other plans and projects, is likely to have a significant effect on a European site;
- Stage 2 – Appropriate Assessment: To determine whether, in view of a European site's conservation objectives, the plan (either alone or in combination with other projects and plans) would have an adverse effect on the integrity of the site with respect to the site structure, function and conservation objectives. If adverse impacts are anticipated, potential mitigation measures to alleviate impacts should be proposed and assessed;
- Stage 3 – Assessment of alternative solutions: Where a plan is assessed as having an adverse impact (or risk of this) on the integrity of a European site, there should be an examination of alternatives (e.g. alternative locations and designs of development); and
- Stage 4 – Assessment where no alternative solutions remain and where adverse impacts remain: In exceptional circumstances where no alternative solutions remain and where adverse impacts remain (e.g. where there are imperative reasons of overriding public interest). Compensatory measures would usually be required to offset negative impacts.

Consideration has been made of the European Sites within this Environmental Report. All such sites were identified and have formed an important consideration of site sensitivity. The catchment proformas were also used to help inform the undertaking of a HRA of the DWMP and as such HRA Stages 1 and 2 have been carried out for the DWMP and the assessment results presented in a separate HRA Report. The HRA undertaken to date has concluded that taking into account the proposed outline mitigation measures, it can be concluded that it is unlikely that the DWMP will have an adverse effect on the integrity of the European sites either alone or in-combination with other plans and projects.

4. Methodology

Water UK guidance on DWMPs advises that “*undertaking an SEA on the final optimised DWMP would be ‘best practice’ and is recommended. In developing the options, the approaches outlined include a requirement to assess their overall environmental and societal impact, aligned to the requirements of an SEA*”.

This chapter sets out a summary of the proposed assessment methodology in relation to completing a high level assessment following the principles of SEA, including identifying how environmental issues are considered through the DWMP option development and appraisal process.

This environmental assessment process has followed current guidance on the application of an SEA assessment process to DWMPs including incorporating best practice within the proposed approach. Key guiding documents (drawing on good practice for water resources and wastewater) have included:

- UK Water Industry Research (UKWIR) environmental assessment guidance
- WRSE Regional Plan
- SEA Core Objectives Identification, All Companies Working Group

With the aim to integrate environmental considerations at the earliest stages of plan making, Thames Water undertook a bespoke environmental assessment on individual options denoted as Generic Sub Options (GSOs) presented at the Options Development Appraisal (ODA) stage (see Figure 3-1) of the DWMP process. The process applied three key steps, summarised in Section 4.1, with outputs utilised in Programme Appraisal (PA). This assessment then built upon this early ODA stage.

It must be borne in mind that, in the majority of cases, specific locations of the GSOs are not yet determined and this assessment is therefore necessarily generic in its approach.

This assessment presents Likely Significant Effects (LSE) based on a combination of the magnitude of impact of GSOs and the sensitivity of the locations, principally the drainage and wastewater catchments, within which the GSOs are proposed. The disproportionately large catchments within the London region (i.e. Beckton, Crossness, Mogden, Riverside, Deephams, Long Reach, Beddington and Hogsmill catchments) are split into constituent London Risk Zones. The Plan includes GSOs at both the London Catchment and London Risk Zone level, and this is reflected in this assessment.

4.1. Generic Sub Options - Magnitude of Impact

It is the purpose of SEA to understand what, if any, significant (moderate or major) environmental effects (either positive or adverse) may be anticipated as a result of the Plan. This assessment therefore interrogated all proposed GSOs contained within the Programme Appraisal in order to understand their likely impacts on the surrounding environment. While not all GSOs are promoted in this Final iteration of the Plan development, this assessment reflects the full range of potential GSOs, as reported in Table 4-1:

Table 4-1 – Potential GSO's and Descriptions

GSO ID	GSO Name	GSO Description
B1.1	Source control SuDS measures	Installation of surface water management devices to collect, store and infiltrate surface water from buildings and surrounding impermeable areas such as driveways and car parks. This option includes residential properties, schools and other public buildings, commercial and industrial buildings. Installation of surface water management devices to collect, store and infiltrate surface water from roads, pavements and pedestrianised areas.
B1.2	Targeted source control SuDS measures at opportunity areas	Delivery of large-scale surface water management strategies across the catchment's opportunity areas to significantly reduce the total flow entering the sewer network at these locations.
B2.1	Combined sewer separation (1). Convert existing combined sewers to surface water only and construct new foul water sewers.	Progressively convert existing combined sewer networks into surface water networks by constructing a parallel foul sewer network (gravity, vacuum or pressurised).
B2.2	Combined sewer separation. Construct new surface water sewers.	Fully below / above ground surface water sewer network collecting different types of run off and conveying to receptor which could be a local watercourse, a major watercourse or a water reuse point.
B2.3	Disconnect existing surface water systems from combined sewers & discharge to watercourse	Progressively disconnect surface water sewers from existing combined sewer networks and direct discharge to suitable receptors (gravity, vacuum or pressurised).
B2.4	Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s)	Deep tunnel network to capture SW flows from major strategic sink points across the city and convey it to a major reuse or discharge location. Assumed that this approach would only be used where natural surface level pathways are insufficient.
B2.5	Combined sewer separation. Convert existing combined sewers to foul water only and convey surface water on the surface using SuDS measures.	Fully above ground system (highways, swales, channels etc.) collecting highway and building flows and conveying to local watercourse or re-use point.

GSO ID	GSO Name	GSO Description
B2.6	Re-create historical rivers to convey surface water	As per description – this option would require activities to open up the lost watercourse and the conveyance infrastructure to get the surface water to the water course.
B2.7	Use parks and urban spaces to store excess surface water during rainfall events	Daylight surface water systems through parks to create a water-based public amenity with a well-defined flood plain to be used for exceedance events and/or allow surface water systems running through/under urban social spaces to flood (during extreme events) into a well-defined sacrificial storage area within the urban space. Could involve daylighting some or all of the surface water flow path but keep buried if more appropriate.
B2.8	Use highways to store and convey surface water during rainfall events	Highways designed to retain water when gullies and/or the sewer network are unable to accept any more flow and/or highways to convey exceedance flows as a secondary function when sewer network capacity is reached with further protective receptor measures to be taken at topographical low points.
B3.0	Property-level protection measures to prevent buildings from flooding	Provide vulnerable homes with passive flood protection measures such as flood proof doors and/or provide vulnerable homes with active property flood resilience measures such as self-sealing bath/shower systems (non-return valves). Active measures could also include the installation of FLIPs (anti-flood) devices. Temporary raised barriers erected in response to flood predictors in order to create a flow retention storage volume to avoid damage to property. Increase thresholds of commercial properties to protect from more severe floods (future-proof). Develop and build partnerships with strategic asset owners and operators to provide resilient flood protection measures. Develop and build partnerships with property developers, product suppliers and the insurance industry to provide a framework for offering high quality affordable property flood protection measures.
C1.0	"Intelligent" sewer network to control flows	Active System Management (ASM) at key points in the network to optimise available network capacity by balancing network flows. E.g. Automation of weir chambers on trunk sewers. Requires deployment of sewer monitors for live/predictive modelling. Active system management at key pumping stations across the network to optimise available network capacity by balancing network flows. Requires deployment of sewer monitors for live/predictive modelling. Ability to monitor and control flow at pipe/chamber level. Integrate energy and cost monitoring from operational sites into active system management decision-making process.
C2.0	Proactive maintenance	Condition based maintenance at all pumping stations; Use of intelligent autonomous vehicles to survey sewer network, highlight/prioritise repairs and carry out repair and maintenance work from within the sewer.

GSO ID	GSO Name	GSO Description
C3.1	Increase network capacity by installing larger sewers	Supplement or replace existing sewers in most beneficial locations with larger sewers to increase network capacity.
C3.2	Deep tunnel(s) to convey combined sewage	Deep tunnels to convey combined sewage to treatment location. Creates conveyance capacity for storm water.
C4.0	Deep tank(s) and tunnel(s) to store combined sewage	Deep tanks and tunnels to convey combined sewage to treatment location. Creates conveyance capacity for storm water.
C5.0	Sewer lining to target infiltration hotspots	Programme of sewer and manhole lining in areas of high infiltration and high potential benefit.
C6.0	Transfer flow between catchments via existing connections	Connections exist between the catchments and also between some of the STWs. These connections could be used to transfer flows between catchments without capacity to those with short term capacity.
C7.0	Transfer flow between catchments via new connections	This option is about creating new connections between the STW catchments to optimise capacities and to find the best balance of flow and load i.e. removing catchment boundaries. It would allow utilisation of the short term capacity in some STWs whilst other STWs are expanded or redeveloped. Similar to the London Water Ring Main this could be a large infrastructure project that would allow most/all catchments to discharge into a single infrastructure pipe/tunnel and then allow any or all of the STWs to extract from this ring main and treat the flows. Reliant on availability of suitable STWs - London may be the only possible location for such a strategic option
C9.0	Intercompany wastewater transfers	This option would be about transferring sewage effluent from catchments within the TW operating area to STWs in neighbouring water and waste companies that may have spare capacity.
D1.1	Screening in the network	Removing screenings in the network would result in less blockages and optimal use of sewer capacity. Less screenings arriving at STW would reduce the risk of screens being overwhelmed on the site resulting in out of service plant thus increasing the sites resilience. Technology such as coarse or fine screens could be used. Skips and odour control would be required.
D1.2	Remove Fats, Oils and Grease in the network	Removing FOG in the network would result in less blockages and optimal use of sewer capacity. For removal in the catchment then technology such as Dissolved Air Flotation (DAFs) could be used to remove grease. This would require additional storage tanks in the network.

GSO ID	GSO Name	GSO Description
D1.3	Primary settlement in the network	Primary treatment in the network would reduce the requirement for similar capacity at STW. This would only be possible where the volume of settled flow can subsequently be diverted directly to secondary treatment. Compact technology with associated sludge holding tanks could be located near major pumping stations.
D1.4	Chemical Treatment within the network (Ferric)	Adding iron to the network reduces septicity and enhances primary treatment at the site. This improves the treatability of the sewage and also improves the performance of existing processes.
D1.5	Biological treatment within the network	Adding return activated sludge (RAS) to a sewer system would provide additional biological treatment within the network allowing for reduced secondary treatment on site. Periodically oxygen would have to be added to continue the biological treatment. Typically, this would involve blowing air into the flow. Multiple aeration points within the network would be required.
D1.6	Other within-sewer treatment	Within-sewer treatment options (e.g. fatberg dissolving enzymes, peroxide) to begin treatment processes in advance of sewage treatment works. Eliminates or reduces risk of blockages and corrosive by-products).
D2.1	Optimising maintenance performance	Opportunities presented by digitization are being used to offset the issues of ageing infrastructure and capacity shortfalls to meet increasing demand. Digitization can provide a better understanding of both networks and treatment processes thereby extending asset life and increasing treatment capacity. In addition, digitization can generate “Smart Data” to make informed decisions to increase plant capacity and performance. Capital maintenance regimes can vary from a ‘fix on fail’ approach for less critical assets to a more proactive rolling replacement programme for some key assets such as aeration domes. Enhanced capital maintenance is about a strict planned rolling programme of proactive maintenance that not only ensures that the assets are fixed quickly when failed but likely they are maintained (e.g. oiled and greased or strengthened) to prevent failure or premature failure. Operations teams are under increasing pressure to maintain availability, throughput and consent. The increasingly tight process and control envelope, the bolstering options being considered, and the potential new process solutions mean that a successful ‘in consent’ works requires the operations team to be ‘on board’ and fully conversant with all solutions & installations. An aim from this initiative would be to facilitate a greater understanding of the impact of operational changes. The management of these STWs can involve complex biological and chemical interactions and flow management. A better understanding of the elements of the system and the use of the data available may allow the sites to be run with less headroom.
D2.2	Real Time Control Implementation (including SCADA upgrades and automation)	Real Time Control (RTC) is about managing and controlling the works based on the actual flows and loads arriving at the site rather than on a set profile. This could be on secondary treatment plant, sludge thickening or even in reaction to rainfall radar and smart sewer sensors that allow the works to prepare for high flows by dropping the sludge blankets, desludging primary settlement tanks or changing DO targets.

GSO ID	GSO Name	GSO Description
D3.0	Replace/retrofit/expand existing primary/secondary treatment processes using existing process types or more intensive processes	Chemically Assisted Primary Sedimentation (CAPS), Dissolved Air Flotation, Lamellas, and sand ballasted primary treatment are some of the 5+ methods of getting more intensive Primary treatment from a smaller area of land than traditional processes. There are a range of different technologies that have been identified for increasing the intensity of secondary treatment processes at the STW either with retrofitting or new build e.g. modular stacked treatment processes.
D4.1	Buy land and expand STW (Effluent and sludge treatment)	Buy land and expand STW (Effluent and sludge treatment)
D4.2	Buy land and move sludge treatment to new location. Expand effluent stream on remaining land.	Buy land and move sludge treatment to new location. Expand effluent stream on remaining land.
D5.0	Construct new/additional STWs	Option involves construction of new treatment works within the catchment (meeting either single or multiple catchment needs) - effective decentralisation of treatment. Increased centralisation of STWs with decommissioning of those considered as surplus to requirement.
D7.1	River catchment-based discharge permitting	Catchment-based discharge permitting (optimising operational and environmental headroom). Some deterioration or less stringent discharge permit criteria allowed in certain locations with conditions improved elsewhere (potentially more stringent permit criteria at certain sites). Net overall benefit.
D7.2	Environmental effects based permitting	Discharge permitting based on bioavailability or ecological impact rather than water quality. Reflects the fact that the relationship between water quality and ecological quality is often non-linear and difficult to predict.
D7.3	Treatment process-based permitting	Treatment process-based permitting where the permit requires specific treatment processes and conditions to be deployed at a site (rather than the discharge quality that should be achieved) - permit compliance determined through provision of evidence that influents have been subject to the agreed treatment processes (follows example of sludge treatment principles).
D8.1	Real-time quality monitoring and dynamic consenting	Real-time effluent and receiving water quality monitoring to improve statistical confidence, reduce uncertainty and allow for dynamic consenting.
D8.2	Real-time quality monitoring with automated process response	Real-time / continuous effluent and receiving water quality monitoring (improves confidence / reduces uncertainty) in conjunction with automated re-treatment / selective recirculation (or diversion to emergency tertiary treatment process) of low quality effluent to maximise discharge of quality effluent. Permit criteria considers ecological sensitivity of receiving water (seasonality, specific species requirements etc.).

GSO ID	GSO Name	GSO Description
D9.1	Treatment of diffuse pollution sources (inputs to river)	Treat the chemical inputs to the river from sources other than STWs (e.g. from agriculture, road and trading estate run-off) in lieu of STW-based treatment options to achieve the equivalent environmental outcome.
D9.2	Treatment of diffuse pollution sources (inputs to sewer)	Treat chemical inputs from non-water sector sources to reduce ultimate wastewater process treatment requirement.
D9.3	Treatment of point pollution sources (inputs to sewer)	Pre-treat trade/industrial effluent. In combination with active/continuous trade-effluent monitoring (to check and verify compliance). This would be treatment at source before it is input to the sewers.
D9.4	Control of chemicals at source	Source control / supply chain management and engagement - setting procurement standards that preclude the use of (or limit) certain chemicals.
D12.1	Sludge Transfers (cross-company, internal, from centralised STW)	Sludge transfers as described.

To derive significance of effect, this environmental assessment provides a consideration of the DWMP GSO list in order to understand the likely magnitude of impact that might be introduced by each GSO. A description of each of the GSOs, alongside typical construction impacts and mitigations considered at design, construction and operation, is collated to inform an impact magnitude scoring rationale included against each of the SEA Objectives. This is used to justify classifications of high, medium, low and negligible beneficial and adverse impacts, and is reported in Magnitude of Impact Proformas for each of the GSOs in Volume 2 (Appendix C).

4.2. Sensitivity of the location

At this stage, with the exception of GSOs that are specific to existing treatment works, it is not known where within each wastewater catchment or London Risk Zone the various GSOs will be implemented. The approach therefore applies a sensitivity (high, medium or low) to each of the catchments, London Risk Zones and existing STW boundaries against each of the SEA topics. To do so, a set of high level spatial 'rules' were derived that considers proximity to, and density of, environmental constraints, as reported in Table 4-2. These rules have been developed and refined through previous SEA experience and further guided by technical specialists. While the rules do not attempt to be exhaustive in the range of datasets considered, they allow for an initial assessment of each catchment that is proportionate to the level of detail available at this stage (including the lack of precise locations for interventions). The rules include buffer zones in order to help understand sensitivity of surrounding environments and therefore the potential for indirect effects. It is important to emphasise that it is not the intention that every type of designation or environmental feature is noted within these 'rules', rather a suite of indicators is used that provides a broad, but precautionary, indication of an individual catchments sensitivity for each Environmental topic. Specific environmental issues are still considered and noted for each catchment and are detailed on specific catchment proformas.

This approach utilised Geographic Information Systems (GIS) to determine sensitivity of each location through integration of a suite of open-source GIS datasets representative of the SEA topics and high level decision guiding questions (presented in Table 7-2). The GIS tool integrated and then tested each location against the rules set out in Table 4-2, returning respective high, medium and low sensitivities. The GIS tools also produced catchment proformas which provide the context for the sensitivities derived and supporting map outputs.

Data on locational sensitivity, including receptor counts and the sensitivity attributed to each location is provided in proformas attached to this environmental assessment in Volumes 3, 4 and 5. The GSOs promoted in each catchment, London Risk Zone and existing STW sites are also identified in the proformas. Supporting maps are provided as Volume 6 Appendices J, K and L.

Table 4-2 – Location Sensitivity

SEA Topic	High	Medium	Low
Biodiversity	Intersects internationally designated sites for Nature Conservation (SPA, SAC, Ramsar) And / Or Intersects Nationally designated sites for Nature Conservation (SSSI and NNR)	Within 10km from internationally designated sites for Nature Conservation (SPA, SAC, Ramsar) And / Or Within 2km from Nationally designated sites for Nature Conservation (SSSI and NNR) And / Or Intersects Locally designated sites for Nature Conservation (LNR) And / Or Intersects Priority Habitat areas	Greater than 10km from internationally designated sites for Nature Conservation (SPA, SAC, Ramsar) And / Or Greater than 2km from Nationally designated sites of Nature Conservation (SSSI and NNR) And / Or Outside Locally designated sites for Nature Conservation (LNR) And / Or Outside Priority Habitat areas

4.3. Deriving Likely Significance of Effect

The following matrix (Table 4-3) was then applied to combine considerations of locational sensitivity against the GSO impact magnitude in order to derive the Likely Significance of Effect (LSE) of GSO's. The significance of effect can be presented as a code, score or by term, as shown in Table 4-4.

Table 4-3 - Significance of Effect Matrix

Location Sensitivity	GSO Magnitude of Effect									
	High		Medium		Low		Negligible		Neutral	
High	+3	-3	+2	-2	+2	-2	+1 / 0	-1 / 0	0	0
Medium	+2	-2	+1	-1	+1	-1	0	0	0	0
Low	+1	-1	+1	-1	0	0	0	0	0	0

Table 4-4 - Significance of Effect Outputs

Significance of Effect	Score (utilised for embedding environmental performance in ODA and Programme Appraisal stages)	Code
Major beneficial	+3	+++
Moderate beneficial	+2	++
Slight beneficial	+1	+
Neutral / Negligible	0	0
Slight adverse	-1	-
Moderate adverse	-2	--
Strong Adverse	-3	---

4.3.1. How findings are set out

In order to focus the environmental assessment on GSOs within the Plan that are likely to give rise to significant effects, this assessment screens the results and then provides high level commentary and discussion on those GSOs where significant effects have been identified. Those GSOs without likely significant effects (minor beneficial and adverse or neutral) identified across each of the SEA topics are not reported further in this assessment.

5. Review of relevant Legislation, Plans and Programmes

5.1. Introduction

The first task of an SEA is the identification of other relevant plans, policies, programmes (PPPs) and legislation. This helps to identify relevant environmental and wider sustainability themes, baseline information and key issues. The DWMP must be prepared to take these PPPs into account as it may influence and be influenced by them.

The SEA Regulations specifically state that information should be provided on:

"The relationship [of the plan or programme] with other relevant plans and programmes"

"The environmental protection objectives, established at international, [European] Community or [national] level, which are relevant to the plan or programme and the way those objectives and any environmental considerations have been taken into account during its preparation"

As such, this environmental assessment considered a wide range of PPPs to help inform understanding of the wider context of the DWMP and the Plan area.

5.2. Methodology

Both the DWMP and this high-level Environmental Report should be set in the context of international, national (UK wide), regional (taken for the purposes of this study to be the SE of England / Water Resource South East plan area) and local (local authorities within and immediately adjacent to the DWMP area) objectives along with environmental, strategic planning and drainage policies

Relevant plans and programmes include those at different levels (international, national, regional and local) which influence the DWMP, or those in other sectors which contribute, together with the DWMP, to environmental conditions of the area to which they apply.

Volume 2 Appendix B lists the documents reviewed to identify environmental themes. A series of key generic themes within the context of drainage and wastewater management planning which have emerged from the review are presented below.

5.3. Environmental Themes

The review of PPPs revealed a large number of common themes in terms of their objectives relating to environmental sustainability within the context of drainage and wastewater management. These are listed below:

Air Quality

- Reduce emissions of NO₂
- Increase use of low emission / zero emission at point of use vehicles
- Reduce emissions of PM₁₀ and PM_{2.5}

Greenhouse gas (GHG) Emissions

- Reduce GHG emissions, particularly CO₂
- Maximise the use of renewable energy
- Increase energy efficiency and make use of new technology
- Minimise use of fossil fuels
- Contribute to the achievement of Net Zero Carbon

- Thames Water to achieve Net Zero for operational emissions by 2030 and carbon net negative by 2040.

Adaptation to a Changing Climate and Flooding

- Prepare for extreme weather events and sea level rise
- Minimise the risk and impact of river, surface and groundwater flooding
- Minimise risk and impact of coastal flooding and erosion damage
- Minimise risk and impact of heatwaves, wildfires, reduced water availability and soil desiccation

Biodiversity, Fauna and Flora

- Protection of sites designated for nature conservation purposes and areas of irreplaceable habitat
- Protect and enhance endangered or important species and habitats
- Contribute to the delivery of biodiversity strategies and plans
- Increase area of important habitat
- Protect, maintain and enhance natural habitat networks and green infrastructure, to avoid fragmentation and isolation of networks, including nature recovery networks
- Creation of green infrastructure
- Achievement of Biodiversity Net Gain

Cultural Heritage

- Conserve and protect historic assets (designated and undesignated) and those of cultural note, including archaeology and historic landscapes
- No harm to physical assets and their settings
- Improve setting to historic assets, including buildings and landscapes of value where appropriate

Water and Wastewater

- Protect and improve the quality of ground and surface water
- Help to meet objectives of the Water Framework Directive (WFD) Regulations
- Make use of Sustainable Drainage Systems (SuDS)
- Prevent or limit inputs of pollutants into groundwater
- Reduce internal and external incidence of property flooding
- Reduce unsatisfactory intermittent discharges
- Reduce out of sewer flooding
- Monitor and provide information to regulators on effluent discharges
- Promote efficient use of water
- Accelerate measures to reduce nutrient overload, particularly from diffuse pollution
- Make space for water and wildlife along rivers and around wetlands
- Restore natural processes in river catchments, including ways to support climate change adaptation and mitigation

Land Use, Soil and Agriculture

- Prioritise development on brownfield sites
- Seek to reclaim derelict and contaminated land

- Prevent soil contamination
- Protect farmland and soils, particularly those considered Best and Most Versatile Agricultural Land
- Promote change of agricultural land use to forestry to help with carbon sequestration targets

Landscapes and Townscapes

- Protect and enhance landscape and townscape character and local distinctiveness
- Protect tranquillity from the impacts of noise and light pollution
- Protect and enhance seascapes

Natural Resources and Waste

- Ensure efficient resource use and minimise resource footprint
- Use secondary and recycled materials
- Consider opportunities to maximise on-site re-use of materials
- Employ waste reduction methods to minimise construction and maintenance waste
- Reduce the amount of waste disposed at landfill
- Promote circular economy
- Avoid the sterilisation of mineral resources

Population and Human Health

- Tackle poor health by improving the health of everyone, and of the worst off in particular
- Create a green economy and promote sustainable growth
- Promote sustainable and healthy communities
- Promote social inclusion and community participation
- Address pockets of deprivation
- Provide for an ageing population

Cross cutting

- Support the UK Government's 25 Year Plan to Improve the Environment 2018 goals and key actions as follows:
 - Using and managing land sustainably, including embedding an "environmental net gain" principle into development.
 - Recovering nature and enhancing the beauty of landscapes.
 - Connecting people to the environment to improve health and wellbeing.
 - Increase resource efficiency and reducing pollution.
 - Securing clean, healthy and productive and biologically diverse seas and oceans.
 - Protecting and improving the global environment.
- Support Environment Act 2021 stipulations:
 - Targets for four priority areas: (a) air quality; (b) water; (c) biodiversity; (d) resource efficiency and waste reduction to be set.
 - Two priority areas: air quality (PM_{2.5} air quality target) and biodiversity (species abundance target) and important new target to reverse the decline in species abundance by the end of 2030.
 - Environmental improvement plan for significantly improving the natural environment for a period no shorter than 15 years.

- 10% biodiversity net gain required for new development.
- Prevent waste/reduce the amount of a product that becomes waste and increase re-use, redistribution, recovery and recycling.
- Adhere to Thames Water commitment to becoming operational net zero carbon by 2030 and carbon net negative by 2040. TW have set out four high level themes to help progress towards net zero by 2030:
 - Reduce: Design and operate TW assets so they emit as few carbon emissions as possible.
 - Decarbonise: Provide the same capabilities using lower carbon technologies.
 - Create a net negative future: Grow TW export of renewable energy products and procure renewable energy when there is no opportunity to decarbonise our supplies.
 - Sequester and offset: Consider carbon offsets, carbon capture and storage, and carbon sequestration opportunities.
- Adhere to Thames Water Environment Policy 10 priority themes:
 - Comply with all applicable environmental laws and regulations;
 - Compliance with environmental permit requirements;
 - Complete all schemes necessary to meet new environmental regulations;
 - Work closely with external regulatory bodies to ensure emerging environmental obligations are addressed appropriately;
 - Protect and enhance biodiversity;
 - Continued maintenance of networks and treatment works;
 - Sustainably manage water resources;
 - Adopt a catchment-based approach to planning and delivering our water and wastewater services;
 - Manage carbon emissions through optimisation and innovation of current and new processes; and
 - Aim to be a socially responsible business working in partnership with a wide range of stakeholders across the region.

6. Baseline and Key Environmental Issues

For the purpose of environmental baseline gathering, three geographic levels of baseline reporting were collated. A regional level of baseline, covering the Environmental Report adopted Plan Area (see Section 3.2) and South East of England, has been provided in order to develop understanding of issues at a regional scale and is supplemented by other regional reports including the Water Resources South East Scoping Report⁴. Secondly, a 'Plan Area' level of baseline, taken to be all Local Authorities containing Thames Water drainage and wastewater catchments has been presented in order to identify and provide greater focus on the environmental constraints of relevance to the Plan.

In addition, a local level of baseline can be interpreted from the location proformas (provided in Volumes 3,4 and 5) which capture all catchments, London Risk Zones and existing treatment works where GSOs have been proposed in order to inform the assessment of solutions. These proformas identify the receptors which inform the attribution of locational sensitivity and identify the GSOs proposed at the location, as discussed in Section 4.2.

6.1. Data analysis

The baseline data provides an overview of the environmental characteristics of the DWMP Plan Area. This overview, together with contextual information, is presented in Table 6-1. The analysis of the baseline has highlighted a number of key issues in the Plan Area.

6.2. Data Limitations

It is believed that the data sets included in this assessment allow for the robust interpretations of locational sensitivity to be made that is proportionate to the level of detail currently understood in respect of each solution. The review of baseline information, relevant plans and policies and other documents in the water sector, such as those produced by the WRSE and All Companies Working Group, also act to bolster and confirm the objectives used in this environmental assessment.

6.3. Key Environmental Baseline, issues and implications/opportunities

The following sections provide an overview description of key baseline data and associated environmental issues, together with a discussion on the implications/opportunities of such issues to the DWMP. The analysis of baseline data and environmental issues has influenced the development of the Assessment Framework (see Section 7 - Assessment Framework) in terms of formulating environmental objectives and decision aid questions. Further narrative in respect of environmental baseline is provided as Volume 2 Appendix A and in Volumes 3,4 and 5.

⁴ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](#)

Table 6-1 - Key Issues, Implications and Opportunities for the DWMP

Key Environmental Issue	Implications / Opportunities for the DWMP	SEA Objective
Air and Climate Air pollution impacts on public health, the natural environment and the economy. Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Poor air quality is generally associated with urban/industrial areas and major road infrastructure and this is reflected in the typical location for Air Quality Management Areas (AQMA), many of which have been designated due to high NO₂ and PM₁₀ levels. A high proportion of the local authorities which fall within the South East region contain at least one AQMA and are predominately designated for Nitrogen Dioxide (NO₂) and Particulate Matter (PM₁₀). There are 83 AQMAs declared within the Plan Area. Approximately 3,126 Noise Action Important Areas have been identified within the Plan Area. The source of noise in these areas is predominately roads, with the exception of a small number in which the source is rail. Based on the local authorities which fall within the South East region, the total carbon dioxide (CO₂) emissions for 2018 across all sectors is estimated at 95,371 kilo tonnes (ktCO₂) (not including Land use, land-use change, and forestry (LULUCF)). Efforts in relation to addressing climate change have been bolstered by a Climate Change Strategy which aims to 'Deliver and promote an integrated, accessible, affordable and reliable public and active (walking or cycling) transport system across the County, thereby reducing journeys and improving local air quality for improved health and wellbeing of our residents'. Nevertheless, some degree of climate change will occur, with the UK's Climate Projections showing that the UK as a whole is likely to experience hotter, drier summers, warmer, wetter winters and rising sea levels. This is likely to have a significant effect on a range of environmental conditions, including the water environment.	The Plan should aim to protect and enhance air quality where possible. It should seek to support strategies that aim to reduce air pollution. This could be achieved through implementation of best practice construction techniques, careful siting of new drainage and wastewater infrastructure and review of operational activities associated with drainage and wastewater e.g. incineration of sludge, use of generators and 'greening' of electricity supply at treatment works, telemetry stations and vehicle fleet. The Plan should aim to contribute to Government targets for air quality and be reflective of appropriate legislation and should consider ecological receptors alongside human receptors when dealing with air quality. Current observations indicate that the UK is continuing to warm. The South East region is projected to have hotter and drier summers, and wetter and warmer winters. Extreme weather events are also predicted to occur as a result of climate change. There is potential that this could affect water treatment capacity through increased flooding and drought for which the plan must account.	To reduce air pollutant and greenhouse gas emissions To adapt and improve resilience to the threats of climate change

Key Environmental Issue	Implications / Opportunities for the DWMP	SEA Objective
Water There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. For the purposes of taking a holistic approach to management of water resources and to address the pressures on the water environment, under the Water Framework Directive (WFD), the UK has been divided into a series of 10 River Basin Districts (RBD). Those of relevance to the Plan Area are: - South East - Thames - Anglian - South West - Severn As with most water bodies in England, there are a range of significant water management issues manifested in these RBD. For example, pollution from wastewater is a significant issue within the Thames RBD, with 45% of water bodies affected by this. Pollution from towns, cities and transport is also noted as being an issue for 10% of water bodies in the Anglian RBD, 9% of those within the South East RBD and 17% in Thames RBD. Groundwater provides a third of drinking water in England, and it also maintains the flow in many rivers. In some areas of Southern England, groundwater supplies up to 80% of the drinking water. Protecting these sources (along with any private water supplies) will help ensure that water is safe to drink. 24 Drinking Water Safeguard Zones (DWSZ) fall entirely or partially within the Plan Area. In order to help protect sources, Source Protection Zones (SPZs) for groundwater sources such as wells, boreholes and springs used for public drinking water supply have been defined. There are several SPZs noted within the Plan area.	The Plan options should seek to maximise opportunities to improve waterbody quality through the suite of interventions proposed in respective catchments. Many of the options are associated with benefits in respect of flood alleviation, reduced instances of out of sewer flooding and treatment, and storage capacity improvements which will act to alleviate water quality pressures. Reducing spills into receiving watercourses is a key outcome of many of the options contained within the DWMP and the plan should seek out areas that stand to benefit most from such interventions Pollution prevention should be sought during construction through robust construction management plans and pollution prevention plans. By their nature, many of the options will likely be situated in close proximity or interact directly with watercourses and therefore construction and operational activities must be closely monitored. This would include understanding potential implications for flow regimes of rivers.	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies To reduce and manage flood risk
Biodiversity Within the South East region, there are a wide range of sites designated for nature conservation. Of note, there are 21 Ramsar sites, 25 Special Protection Areas, 69 Special Areas of Conservation and 1,189 Sites of Special Scientific Interest.	The Plan should aim to protect and enhance all sites of biodiversity importance and should place a particular emphasis on protecting sites designated for nature conservation and geodiversity purposes. This could be achieved by ensuring that the planning / design	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area

Key Environmental Issue	Implications / Opportunities for the DWMP	SEA Objective
Specifically within the Plan area there are: • Nine SPA's (Thames Basin Heath; Wealden Heaths Phase II; South West London Waterbodies; Salisbury Plain; Arun Valley; Pagham Harbour; Lee Valley; Porton Down; and Thursley, Hankley & Frensham Commons); • 39 SAC's; and • 778 SSSIs. Within the South East region, 86 National Nature Reserves and 480 Local Nature Reserves can be found. Within the Plan area there are 31 NNRs and 410 LNRs. Pagham Harbour and Swanscombe Marine Conservation Zones also intersect the Plan Area. Key pressures and risks in respect of biodiversity and nature conservation that are particularly relevant have been identified from air pollution and climate change, which can change distribution of species and habitats. Areas of Ancient Woodland, i.e. those areas that have been continuously wooded since at least 1600AD are scattered across the South East region. The Ancient Woodland Inventory for England identifies over 2,300 sites of Ancient Woodland, within the Plan Area.	of drainage and wastewater interventions avoid sensitive areas and through the adoption of best practice wildlife friendly designs. Where this is not possible, there should be mitigation and compensation for losses. Consideration should also be made of protected and priority species and their habitats, as well as consideration of issues such as Suitable Alternative Natural Greenspace Opportunities for new habitat creation and enhancement associated with drainage and wastewater infrastructure should be explored and maximised. Options to restore historic waterways, introduce SuDS and surface water interventions present significant opportunities to integrate and maximise biodiversity and habitat creation, with consequent benefits for recreation and wellbeing.	To strengthen the connections between people and nature and realise the value of biodiversity
Population and Human Health There are approximately 19 million people living within the South East Region, which accounts for 30% of the UK's population. Population is expected to grow which will likely place additional pressure on the water environment within the South East region. Economic growth and climate change will also add to this pressure. Health within the region is generally good, with 83% of people describing their health as good or very good. General health trends within the Plan Area are expected to be in keeping with that reported at the Regional level. The options within the South East regional plan have the potential to result in temporary disturbance effects during the construction phase. There is also potential for impacts on the water or natural environment which could have impacts on recreation and wellbeing.	The Plan should seek to improve human health and well-being through reducing flooding, including out of sewer flooding, improving flood resilience through storage and treatment capacity measures, all of which have consequent direct impacts on health and well-being. Indirectly, health levels could be improved through secondary effects of policies to reduce air pollution; decreasing noise and odour pollution at, for example, treatment works and construction sites. Improving walking and cycling facilities for both purposeful and recreational trips will both improve physical activity levels, as well as decrease air pollution and traffic. Improving access to and provision of greenspace and improving the physical environment in general, may increase both informal and formal physical activity levels, as well as create a general sense of wellbeing. There are, evidently opportunities for such	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities

Key Environmental Issue	Implications / Opportunities for the DWMP	SEA Objective
	enhancements, through options to restore historic waterways and surface water interventions, which should be explored further.	
Material Assets and Resource use Within the UK, the south east is the most populated region with a population of approximately 19 million and expected long-term growth of around four million. Settlements within the South East as a whole, as well as the Plan area, are diverse and range from large population centres such as London, to small rural hamlets and seaside towns. As such, across the region and the Plan area, in addition to residential property, there are significant material assets in the form of transport infrastructure, as well as commercial and industrial premises.	Many of the interventions proposed within drainage and wastewater catchments are situated within predominantly urban areas. The Plan should therefore seek to minimise impact on material assets, as well as resource use (during construction and operation) and reduce waste. Note that assets are taken to include green infrastructure including public parks and gardens, greenspace services and facilities. Conversely the Plan should seek to afford protection from drainage and wastewater related flooding on such receptors, recognising the increased value greenspace and other assets have on physical and mental well-being for example.	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill
Landscapes The South East region's landscape is diverse and there are important landscapes within the region, including two National Parks, eight AONB and 34 National Character Areas. Specifically within the Plan area, there are: - Two National Parks (New Forest; and South Downs); - Eight AONBs (Chichester Harbour; Chilterns; Cotswolds; Cranborne Chase and West Wiltshire Downs; High Weald; Kent Downs; North Wessex Downs; and Surrey Hills); and 34 NCAs. There are a range of pressures on landscape, many of which are altering landscapes in a direction which could be regarded as inconsistent with the traditional landscape vernacular of the area. These changes are a reflection of the fact that the landscape of the UK has changed over many years, due to a range of issues such as urbanisation, changes to agriculture, reduced tranquillity, loss of habitats and forests, etc. In an effort to preserve the best landscapes, a series of National Parks and Area of Outstanding Natural Beauty (AONBs) were designated. There are more than 2,649 Conservation Areas designated within the South East area,	The Plan should seek to preserve, and where possible, enhance the character of the region's landscape by ensuring that its integrity and valuable natural open space is not lost. Design of new drainage and wastewater infrastructure should be sympathetic to the local vernacular architecture when possible. The Plan should also aim to ensure that sensitive areas are avoided and it should respect particular landscape settings, with consideration made of design quality in both an urban and rural setting. Opportunities for landscape enhancement should be explored, e.g. through sympathetic design and enhancements to existing landscape improvement areas, new planting opportunities associated with drainage and wastewater options including surface water SuDS features and works to existing parks (e.g. ponding of surface waters). Where a scheme would involve physical development within a Conservation Area, or a wider area for which a townscape/urban character appraisal has been undertaken, the design of the scheme should take account of	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside

Key Environmental Issue	Implications / Opportunities for the DWMP	SEA Objective
covering a range of building characters and reflecting a diverse array of architectural styles. The Plan Area has approximately 2,430 Conservation Areas within or intersecting the boundary.	relevant guidance for the Conservation Area / townscape character area.	
Soil There are a mix of land uses across the Plan Area, ranging from rural areas of open countryside or arable farmland and pasture, to extensive heavily urbanised areas. There are also areas of suburban and urban fringe associated with the main towns and distinct pockets of 'isolated' urban development in the form of villages and small towns. Soils in England are already, and continue to be, degraded by human activity, including intensive agriculture, historic levels of industrial pollution and urban development (including transportation networks), making them vulnerable to erosion (by wind and water), compaction and loss of organic matter. Many areas of land in the UK have been contaminated by past industrial and other human activities, including former factories, storage depots and landfills. Land at the full range of potentially contaminated sites could be contaminated by a wide range of harmful substances such as oils and tars, heavy metals, asbestos and chemicals. By its nature, it is often very difficult to know where land has been contaminated previously or is currently suffering ongoing contamination. As such, the number of known sites of contamination is likely to be only a very small fraction of the overall number of potentially contaminated sites.	The Plan should seek to make best use of areas that are already urbanised and provide an opportunity for regeneration / improvements to land quality. Where use of agricultural land is unavoidable, measures should be taken to avoid those areas of the highest quality and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance. Such considerations are pertinent in options to expand/ create new treatment works and in linear schemes such as sewer installation. The Plan must protect soils as they are essential for achieving a range of important ecosystem services and functions. Dealing with the past pollution / contamination legacy is a major issue and should be addressed at all opportunities due to its ongoing environmental impact. The Plan should seek to avoid land that is covered by Mineral Safeguarding Area designations, to prevent the sterilisation of key mineral resources.	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management
Cultural Heritage There are eight World Heritage Sites within the South East Region, alongside a wide range of other historic and cultural heritage features located across the region and which span the full range of human settlement, from the prehistoric to the present. These include Scheduled Monuments, Registered Parks and Gardens and Listed Buildings. Numbers of cultural heritage sites within the Plan Area are as follows: World Heritage Sites - 6 Listed Buildings – 79,205 Registered Parks and Gardens – 582 Scheduled Monuments – 3,445	The Plan should aim to protect and preserve designated and non-designated heritage assets and their contexts and settings. Drainage and wastewater related development / infrastructure should be sensitively designed to be sympathetic to its existing character and quality, and opportunities for improving settings should be examined. Where schemes would involve physical development that could affect previously undiscovered archaeological assets, the design of the scheme and site selection should be informed by early	To conserve and enhance the historic environment, the heritage assets therein and their setting

Key Environmental Issue	Implications / Opportunities for the DWMP	SEA Objective
It is important to note that the nature of cultural heritage features means that not all are known at present; in particular, buried archaeological remains.	investigation of the potential archaeological interest of the affected land.	

6.4. Future baseline

The SEA Directive requires that “the relevant aspects of the current state of the environment and the likely evolution thereof without implementation of the Plan or Programme” is identified. Prediction of future trends is difficult because they depend on a wide range of global, national and regional factors and decision making. Key trends have been identified and from an initial review, it is likely that the following trends will continue:

Table 6-2 - Future Baseline

SEA Topic	Key Trends
Air quality	Irrespective of the Plan, new development, economic growth and tourism is expected to lead to increased car journeys and congestion within the area, leading to localised air quality effects. Public transport improvements, national air quality targets and European emissions standards for new vehicles should contribute to reducing future air quality, alongside changing energy sources and improved industrial practices.
Water	Water quality is likely to continue to be maintained and improved through legislation such as the WFD. The region is already water-stressed and projected economic and population growth will likely place further pressure on the region's water resources and water dependent environments. There is potential for an increased need for wastewater treatments as a result of WFD water quality standards, combined with population increase.
Climatic factors	The climate is expected to continue to change, with annual average temperatures projected to increase, particularly in summer. Winters are projected to be wetter and summers drier. Climate change is projected to result in more extreme weather events, potentially causing or exacerbating periods of drought, which alongside population and economic growth, will impact water availability. Carbon and other GHG emissions will continue to be emitted, however regulations and legislation will likely continue to promote the reduction in emissions through commitments to net zero. The water industry in the UK is aiming to become net zero by 2030.
Biodiversity, flora and fauna	Habitats and species are likely to continue to be protected through European and UK legislation. England's wildlife habitats have become increasingly fragmented and isolated, leading to declines in the provision of some ecosystem services, and losses to species populations. Lawton (2010) recognises that future climate change, demographic change, economic growth, new technologies, societal preferences and changes in policy and regulatory environments, may all have profound consequences. However, new legislation such as the Environment Bill is likely to continue protection of biodiversity, by providing a framework for a legally binding target of net gain within the planning system.
Population and human health	Water available for consumptive use may be affected by climate change whereby access to water is limited through more frequent droughts or floods. Population is projected to increase in the region and life expectancy is also higher than the national average, meaning that the numbers of elderly residents are likely to increase. As such, water demand will increase, and further pressure will be placed on water resources within the region.
Material assets	Regeneration and future investment and demand are likely to increase the number and quality of material assets such as housing, transport infrastructure, waste facilities, and community facilities. There are a series of significant infrastructure projects taking place across the region. Continued growth within the region will contribute towards a trend of increased waste and resource use. While new approaches are helping to shift towards greater efficiencies in resource use and adherence to the waste hierarchy, underlying waste generation volumes are anticipated to increase cumulatively.
Landscape	Many of the region's most exceptional landscape and townscapes benefit from protection through designations. Changing and continued development will affect the quality and character of landscapes. However, in general terms, modern design / landscaping principles and interested parties' expectations are promoting a renewed focus on the quality of scheme design and this trend is likely to continue, though risks from increased urbanisation and infrastructure development remain.

Soil	As the population increases it is likely that more brownfield land will be remediated and developed. There is potential for a loss of agricultural land through development pressures.
Historic environment	Historic England recently reported that heritage assets at risk are decreasing. There are now 87 fewer heritage assets at risks than in 2018, with successes in buildings and structures and archaeology. Historic assets will likely continue to be protected through European and UK legislation. Development could put pressure on heritage assets and their setting and there is a risk of uncoordinated and piecemeal development resulting in the successive erosion of the quantum and integrity of the region's cultural heritage resource.

7. Assessment Framework

A key part of the SEA process is the development of the SEA Framework and this DWMP assessment process also developed a Framework in line with these requirements. While no standalone Scoping Report has been undertaken owing to the non-statutory nature of this environmental assessment, the approach adopted benefited from the work undertaken, and consultations made during the DWMP development, with the Environment Agency (EA) and discussions with Natural England (NE). Of note consultation with EA and NE continues to be facilitated through the L1 forums held by Thames Water.

This Assessment Framework formed the basis for predicting and assessing the effects arising from the implementation of the DWMP and has been used to assess the DWMP.

An overarching set of environmental objectives and assessment questions to guide the assessment have been developed and validated through the baseline and constraints and opportunities analysis presented in Section 6 - Baseline and Key Environmental Issues.

Table 7-1 - SEA Objectives

SEA Topic	Objective
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area
	To strengthen the connections between people and nature and realise the value of biodiversity
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies
	To reduce and manage flood risk
Soil	To protect and enhance geology, the quality and quantity of soils, and promote a catchment-wide approach to land management
Air and Climate	To reduce air pollutant and greenhouse gas emissions
	To adapt and improve resilience to the threats of climate change
Cultural Heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting
Landscape	To protect, enhance the quality of, and improve access to, designated and undesignated landscapes, townscapes and the countryside

The following decision guiding questions also aid the assessment:

Table 7-2 - Decision guiding questions

SEA Topic	Objective	Decision guiding questions
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	- Will it protect and enhance aquatic environment, habitats and species? - Will it affect the marine environment, habitats and species? - Will it help to restore the natural ecosystem function and/or promote resilience / adaptation to climate change?
	To strengthen the connections between people and nature and realise the value of biodiversity	- Will it affect the conservation status of any SPA, SACs, Ramsar sites, SSSI or locally designated sites? - Will it bring opportunities for habitat creation or restoration? - Will it affect any habitats that support legally protected species, priority species or species of conservation concern? - Will it contribute to the loss or gain in biodiversity, and/or habitat connectivity? - Will it create areas of improved biodiversity in urban or deprived areas (or locations that are accessible to those areas)?
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	- Will it provide reliable and affordable wastewater services for the health and wellbeing of customers? - Will it have an effect on active lifestyles, such as impacts on active travel through disruption to pedestrian and cycle routes? - Will it protect or enhance opportunities for recreation and tourist activities, such as public rights of way and national trails? - Will it minimise disturbance from noise, light, visual, and transport? - Will local communities be actively engaged to foster an inclusive environment and participate in decision making? - Will it improve access to the natural environment for recreation, including those living within deprived areas? - Will it have an effect on freshwater/marine fisheries for recreational purposes?
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste,	- Will it make use of existing infrastructure? - Will it minimise the demand for resources? - Will it use natural rather than built solutions where appropriate? - Will it minimise the use of energy and promote energy efficiency? - Will it reduce the production of waste and increase the proportion for reuse or recycling?

	encourage its re-use and eliminate waste sent to landfill	
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	- Will it affect surface water quality or quantity? - Will it affect ground water quality or quantity? - Will it contribute to, or conflict with, the achievement of WFD objectives (e.g. Good Ecological Status / Good Ecological Potential)? - Will it improve bathing waters? - Will it protect shellfish waters? - Will it protect chalk rivers? - Will it improve wastewater quality? - Will it reduce the presence of contaminants in waterbodies? - Will it reduce the risk of pollution from any wastewater source on land or in water? - Will it support greater water efficiency and re-use at source? - Will it enable better management of surface water before entering sewers?
	To reduce and manage flood risk	- Will it be vulnerable to flood risk? - Will it contribute to the risk of flooding? - Will it mitigate or reduce the risk of flooding?
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	- Will it affect high grade agricultural land? - Will it protect and enhance the quality of soils? - Will it promote the efficient and sustainable use of land? - Will it prevent soil erosion and retain soil stocks as a natural resource? - Will it prevent mineral sterilisation of land and nutrient loading in water bodies? - Will it create soil/land contamination or involve remediation? - Will it avoid damage to and protect geologically important sites (e.g. geological SSSIs)?
Air and Climate	To reduce air pollutant and greenhouse gas emissions	- Will it decrease the air quality within in an Air Quality Management Area? - Will it affect local air quality?
	To adapt and improve resilience to the threats of climate change	- Will it be vulnerable to climate change? - Will it include climate resilience measures? - Will it adapt to future climatic risks or create opportunities to benefit from potential effects of climate change?

Cultural Heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	- Will it affect designated or non-designated historic assets, sites and features? - Will it affect the setting and/or significance of a historic asset? - Will it affect heritage assets at risk? - Will it improve access, value, understanding or enjoyment of heritage assets and culturally/historically important assets in the region?
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	- Will it have an effect on the character of the landscape, townscape or countryside, including tranquillity and views? - Will it improve access to the countryside? - Will it create or improve green infrastructure? - Will it protect and enhance designated landscapes and features?

8. GSO Assessment

8.1. Assessment

Provided below are the GSOs proposed in at least one of the TW catchments, LRZs or existing STWs, alongside a brief description and unique GSO ID. With respect to each of the SEA Objectives, the magnitude of impact anticipated (in both beneficial and adverse terms) has been considered and reported in GSO proformas contained in Volume 2 Appendix C. These proformas provide commentary on the typical construction impacts, mitigations (at design, construction and operation) and likely magnitude of impact (low, medium or high beneficial and adverse) that might be anticipated through implementation of the option, in absence of any locational factor.

As reported in Section 6.2 - Data Limitations, a number of limitations are present owing to the detail available in respect of each option. Principal among these limitations are data relating to the solution location and its scale. Therefore, while the assessment allows for the identification of LSE across the catchments, the assessment is necessarily generic in approach. It is the intention that this work can be built upon and refined as further detail becomes known and as schemes are taken forward for development.

Table 8-1 - Generic Sub Options (GSOs) briefed

GSO ID	GSO/Solution Name	GSO Description	Promoted in TW Catchments (Excluding London Catchments and LRZs)	Promoted in London Catchments and / or LRZ	Promoted in existing Sewage Treatment Works
B1.1	Source control SuDS measures	Installation of surface water management devices to collect, store and infiltrate surface water from buildings and surrounding impermeable areas such as driveways and car parks. This option includes residential properties, schools and other public buildings, commercial and industrial buildings.	✓	✓	
B1.2	Targeted source control SuDS measures at opportunity areas	Delivery of large-scale surface water management strategies across the catchment's opportunity areas to significantly reduce the total flow entering the sewer network at these locations.	✓	✓	
B2.1	Combined sewer separation. Convert existing combined sewers to surface water only and construct new foul water sewers.	Progressively convert existing combined sewer networks into surface water networks by constructing a parallel foul sewer network (gravity, vacuum or pressurised).		✓	
B2.2	Combined sewer separation. Construct new surface water sewers.	Fully below/above ground surface water sewer network collecting different types of run off and conveying to receptor which could be a local watercourse, a major watercourse or a water reuse point.		✓	
B2.3	Disconnect existing surface water systems from combined sewers & discharge to watercourse	Progressively disconnect surface water sewers from existing combined sewer networks and direct discharge to suitable receptors (gravity, vacuum or pressurised).		✓	
B2.4	Deep tunnel(s) to connect surface water	Deep tunnel network to capture SW flows from major strategic sink points across the city and convey it to a major reuse or discharge location. Assumed that this		✓	

GSO ID	GSO/Solution Name	GSO Description	Promoted in TW Catchments (Excluding London Catchments and LRZs)	Promoted in London Catchments and / or LRZ	Promoted in existing Sewage Treatment Works
	networks to major reuse or discharge location(s)	approach would only be used where natural surface level pathways are insufficient.			
B2.5	Combined sewer separation. Convert existing combined sewers to foul water only and convey surface water on the surface using SuDS measures.	Fully above ground system (highways, swales, channels etc.) collecting highway and building flows and conveying to local watercourse or re-use point.		✓	
B2.6	Re-create historical rivers to convey surface water	This option would require activities to open up the lost watercourse and the conveyance infrastructure to get the surface water to the water course.		✓	
B2.7	Use parks and urban spaces to store excess surface water during rainfall events	Daylight surface water systems through parks to create a water-based public amenity with a well-defined flood plain to be used for exceedance events and/or allow surface water systems running through/under urban social spaces to flood (during extreme events) into a well-defined sacrificial storage area within the urban space. Could involve daylighting some or all of the surface water flow path but keep buried if more appropriate.		✓	
B3.0	Property-level protection measures to prevent buildings from flooding	Provide vulnerable homes with passive flood protection measures such as flood proof doors and/or provide vulnerable homes with active property flood resilience measures such as self-sealing bath/shower systems (non-return valves). Active measures could also include the installation of FLIPs (anti-flood) devices. Temporary raised barriers erected in response to flood predictors in order to create a flow retention storage volume to avoid damage to property. Increase thresholds of commercial properties to protect from more severe floods (future-proof). Develop and build partnerships with strategic asset owners and operators to provide resilient flood protection measures. Develop and build partnerships with	✓	✓	

GSO ID	GSO/Solution Name	GSO Description	Promoted in TW Catchments (Excluding London Catchments and LRZs)	Promoted in London Catchments and / or LRZ	Promoted in existing Sewage Treatment Works
		property developers, product suppliers and the insurance industry to provide a framework for offering high quality affordable property flood protection measures.			
C1.0	"Intelligent" sewer network to control flows	Active System Management (ASM) at key points in the network to optimise available network capacity by balancing network flows. E.g. Automation of weir chambers on trunk sewers. Requires deployment of sewer monitors for live/predictive modelling. Active system management at key pumping stations across the network to optimise available network capacity by balancing network flows. Requires deployment of sewer monitors for live/predictive modelling. Ability to monitor and control flow at pipe/chamber level. Integrate energy and cost monitoring from operational sites into active system management decision-making process.	✓	✓	
C2.0	Proactive maintenance	Condition based maintenance at all pumping stations; Use of intelligent autonomous vehicles to survey sewer network, highlight/prioritise repairs and carry out repair and maintenance work from within the sewer.	✓		
C3.1	Increase network capacity by installing larger sewers	Replace existing sewers in most beneficial locations with larger sewers to increase network capacity.		✓	
C4.0	Deep tank(s) and tunnel(s) to store combined sewage	Deep tanks and tunnels to convey combined sewage to treatment location. Creates conveyance capacity for storm water.	✓	✓	
C5.0	Sewer lining to target infiltration hotspots	Programme of sewer and manhole lining in areas of high infiltration and high potential benefit.	✓	✓	
C6.0	Transfer flow between catchments via existing connections	Connections exist between the catchments and also between some of the STWs. These connections could be used to transfer flows between catchments without capacity to those with short term capacity.	✓	✓	

GSO ID	GSO/Solution Name	GSO Description	Promoted in TW Catchments (Excluding London Catchments and LRZs)	Promoted in London Catchments and / or LRZ	Promoted in existing Sewage Treatment Works
C7.0	Transfer flow between catchments via new connections	This option is about creating new connections between the STW catchments to optimise capacities and to find the best balance of flow and load i.e. removing catchment boundaries. It would allow utilisation of the short term capacity in some STWs whilst other STWs are expanded or redeveloped. Similar to the London Water Ring Main this could be a large infrastructure project that would allow most/all catchments to discharge into a single infrastructure pipe/tunnel and then allow any or all of the STWs to extract from this ring main and treat the flows. Reliant on availability of suitable STWs - London may be the only possible location for such a strategic option	✓	✓	
D3.0	Replace/retrofit/expand existing primary/secondary treatment processes using existing process types or more intensive processes	Chemically Assisted Primary Sedimentation (CAPS), Dissolved Air Flotation, Lamellas, and sand ballasted primary treatment are some of the 5+ methods of getting more intensive Primary treatment from a smaller area of land than traditional processes. There are a range of different technologies that have been identified for increasing the intensity of secondary treatment processes at the STW either with retrofitting or new build e.g. modular stacked treatment processes.	✓	✓	✓
D4.1	Buy land and expand STW (Effluent and sludge treatment)	Buy land and expand STW (Effluent and sludge treatment)			✓
D5.0	Construct new/additional STWs	Option involves construction of new treatment works within the catchment (meeting either single or multiple catchment needs) - effective decentralisation of treatment. Increased centralisation of STWs with decommissioning of those considered as surplus to requirement.		✓	

8.2. Summary of GSOs

This section provides a summary of the magnitude of impact data presented in Volume 2 Appendix C. Table 8-2 provides a count of the magnitudes attributed to each GSO, highlighting those which are considered highly impacting in respect of both positive and negative outcomes.

Table 8-2 - Count of GSO's attributed magnitudes against SEA Objectives

Magnitude of Impact	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	To strengthen the connections between people and nature and realise the value of biodiversity	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	To reduce, and make more efficient, the domestic, industrial, and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	To reduce and manage flood risk	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	To reduce air pollutant and greenhouse gas emissions	To adapt and improve resilience to the threats of climate change	To conserve and enhance the historic environment, the heritage assets therein and their setting	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Total
High (positive)	11	1	2	10	9	9	0	0	6	0	0	48
Medium (positive)	6	10	12	7	8	9	2	1	10	4	2	71
Low (positive)	1	4	4	3	1	2	3	0	3	11	12	44
Negligible (positive)	2	5	2	0	2	0	15	19	1	5	6	57
Negligible (negative)	5	14	5	5	5	5	5	5	17	5	5	76
Low (negative)	1	4	10	13	13	15	4	15	3	11	8	97
Medium (negative)	12	2	5	2	2	0	7	0	0	4	6	40
High (negative)	2	0	0	0	0	0	4	0	0	0	1	7

In isolation of any locational factor, of the 40 potential solutions/ GSOs promoted within the Plan, 48 instances of potentially highly beneficial impacts have been identified. Only seven instances of potentially highly negative impacts have been identified. As shown in Table 8-2, this is in respect of topics of biodiversity, population and human health, material assets, water, and climate change objectives for positive impacts, and biodiversity, soil and landscape objectives for negative impacts. See Tables 8-3 and 8-4 for further details.

Collating each of the GSOs magnitude of impact proformas, 119 instances of significant positive impacts (moderate and highly positive) have been recorded. This is due to the nature of the DWMP and its associated interventions, which are intended to result in improvements in the natural and built environment. For example,

GSO C4.0 'Deep tank(s) and tunnel(s) to store combined sewage' serves to reduce flooding (including out of sewer flooding) and likely reduce overflows into receiving watercourses. The solution therefore has the potential to significantly improve human health, improve water quality of receiving watercourses and reduce pressures on aquatic biodiversity.

It is also important to note at this stage that, in review of the magnitude of impact proformas, significant negative impacts identified are largely associated with construction activities, and are therefore short term, temporary and reversible in nature. For example, construction of SuDS, sewer separation schemes and installation of deep tunnels are all likely to generate construction impacts on a range of natural and built receptors, including biodiversity, water, heritage, landscape, material assets and human health. However, during the operation phase many of these impacts would desist. A small number of exceptions have been identified in respect of solutions which include construction of new STWs, expanding existing STWs and installation of deep tanks and tunnels. This is in respect of a much smaller list of natural and built environment receptors and includes, for example, the permeant loss or damage to soils, habitat and landscape. Respective magnitude of impact tables show that such impacts can be appropriately mitigated and in identifying these issues at this stage, site selection stages can minimise such effects.

Those options with potentially high positive and high negative impacts are detailed in Table 8-3 and Table 8-4 respectively.

Table 8-3 – GSOs attributed high positive impact against SEA Objectives

Highly positive impacting GSO	SEA Objective						
	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	To strengthen the connections between people and nature and realise the value of biodiversity	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	To reduce and manage flood risk	To adapt and improve resilience to the threats of climate change

9. Catchment Sensitivity Assessment

9.1. Assessment

As highlighted in Section 4.2, three location types have been identified for the purposes of this assessment, as follows:

- All Catchments (313 no.)
- London Catchments (8 no.) and London Risk Zones (LRZs) (36 no.)
- Existing Sewage Treatment Works (STWs) (281 no.)

A full list of locations relevant to each of these three location types is provided in Volumes 3, 4 and 5. Of the three location types, only GSOs specific to existing sewage treatment works have a high degree of locational precision. It is not known at this stage where the remaining GSOs within the remaining catchments or LRZs might be located, and such detail is not expected to be known until future iterations of the DWMP.

Each of the three location types have been attributed a sensitivity in line with the methodology set out in Section 4.2 - Sensitivity of the location. The sensitivity of each location assessed against each SEA topic is presented in the Volumes 3,4 and 5 (Catchment Proformas).

With a view to assessment, it is important to note at this stage that increased locational sensitivity does not just highlight areas of greatest constraint, but also areas that might realise the greatest benefit. For example, promoting SuDS in a catchment that is highly sensitive to water, biodiversity and flooding will require careful consideration in respect of construction, but also presents an opportunity to realise more significant water quality benefits to receiving and designated watercourses, as well as reduce instances and severity of flooding events.

9.2. Summary of catchment sensitivity

The following tables present locational sensitivity trends for each of the three location types assessed against each of the SEA topics.

Table 9-1 - Count of All Catchments within each Sensitivity Band (excludes London Catchments, LRZs and existing STW locations)

Catchment sensitivity	SEA Topic								
	Biodiversity	Population and Human health	Material Assets	Water	Soil	Air	Climate Factors	Cultural Heritage	Landscape
Low	90	123	100	60	18	40	98	34	137
Medium	216	176	19	243	286	265	182	140	7
High	7	14	194	10	9	8	33	139	169

Table 9-1 shows that, in respect of various natural and built environment characteristics captured under respective SEA topics, there are broad range of catchments included in the DWMP. For the most part, the majority of the catchments fall under a sensitivity of 'Medium'. However, in respect of the topics of Material Assets and Landscape, the majority of catchments are considered highly sensitive.

Across each of the SEA topics, at least seven of the 313 catchments are highly sensitive and at least 18 are of 'low' sensitivity. Catchment proformas contained in Volume 3 identifies the sensitivity for each of the catchments along with the rationale driving the classifications.

Table 9-2 - Count of London Catchments and LRZs within each Sensitivity Band

Catchment sensitivity	SEA Topic								
	Biodiversity	Population and Human health	Material Assets	Water	Soil	Air	Climate Factors	Cultural Heritage	Landscape
Low	32	43	37	26	8	32	40	2	8
Medium	12	1	6	18	24	12	4	37	0
High	0	0	1	0	12	0	0	5	36

Table 9-2 shows that for the most part, the majority of London Catchments and LRZs fall under the sensitivity of 'Low', with the exception of Soil, Cultural heritage and Landscape. Across each of the SEA topics, at least two of the 44 catchments and LRZs are considered of 'low' sensitivity and in several instances, none are considered to be of 'high' sensitivity. Catchment proformas contained in Volume 4 identify the sensitivity for each of the catchments and LRZs along with the rationale driving the classifications.

Table 9-3 - Count of existing STWs within each Sensitivity Band

Catchment sensitivity	SEA Topic								
	Biodiversity	Population and Human health	Material Assets	Water	Soil	Air	Climate Factors	Cultural Heritage	Landscape
Low	45	256	265	26	74	168	134	279	216
Medium	228	25	6	254	200	113	144	2	11
High	8	0	10	1	7	0	3	0	54

A majority of the existing STW sites fall within the Low and Medium sensitivity bands. No existing STWs are assessed as highly sensitive in respect of Population and human health, Air or Cultural heritage topics. The majority of existing STW sites fall within a low sensitivity band for population, material assets, air, cultural heritage and landscape. Unlike STW catchments, a much smaller number of existing STW sites fall within an elevated sensitivity (medium or high) against topics of population, material assets, cultural heritage and landscape. With the exception of landscape, no more than 10 existing STW sites fall within high sensitivity bands across each SEA topic.

It is recognised that STW sites are generally sited away from receptors, so as to minimise interaction with the natural and built environment. This includes aims to minimise the potential for noise and odour complaints from residents, in part reflected by the majority (256 no.) falling within a low sensitivity band for population and human health. Their situation adjacent receiving watercourses is reflected in increased sensitivity for 256 of the existing STW sites.

10. Significance of Effect

The assessments detailed in this Chapter takes account of all GSO's briefed at the ODA stage within each catchment, LRZ and existing STW site, with the intention that derived significance of effects data across each of the proposed GSO's could be translated and integrated into metrics that inform the content and options promoted in the Final Plan. The bank of assessment data reported here and in associated Appendices can also be called upon to inform environmental appraisal of future iterations of the DWMP. This includes Appendices D, E and F which identify GSO's included and excluded from the Final Plan in respect of each of the three area types, alongside their associated likely significant effects. Environmental baseline proformas for each of the catchments, risk zones and existing STW sites briefed at the ODA stage (as well as at subsequent stages where applicable) and therefore including those that make it to the Final Plan, are included as Volumes 3, 4 and 5.

Using the matrix provided in Table 4-3, the sensitivity of each catchment has been applied to the magnitude of impact data for each GSO to derive potential effects. Note that while all catchments have been analysed, only those catchments, London risk zones and existing STWs that have been attributed at least one GSO at the ODA stage are reported here. A total of 376 locations have been reported:

- Of the 313 no. Catchments (excluding London catchments, LRZs and existing STWs) there are 263 no. which have at least one GSO proposed;
- Of the 44 no. London Catchments and LRZs there are 37 no. which have at least one GSO proposed; and
- Of the 281 no. Existing Sewage Treatment Works there are 76 no. which have at least one GSO proposed.

The following subsections summarise Likely Significant Effects (LSE) for the three area types under consideration at the ODA stage. Please see Chapter 11 (Final Plan) which draws from this chapter only those GSOs and associated significance of effect reporting for those GSOs promoted in the Final Plan.

10.1. All Catchments (excluding London Catchments, LRZ and existing STWs)

Table 10-1 and Table 10-2 display the percentages of catchments where GSOs result in either significant beneficial or adverse effects (Likely Significant Effects (LSE)). The tables show that all GSOs are expected to result in significant beneficial effects across at least 21% of the catchments. Only five of the options (B1.1, B1.2, C4.0, C7.0 and D3.0) are expected to result in significant adverse effects, and this applies across at least 34% of the catchments where these GSOs are promoted.

Table 10-1 - Number of Catchments with LSE (Beneficial) against GSO

GSO / Solution	No. of Catchments where GSO is promoted	No. of Catchments with LSE (Beneficial)	Percentage of all Catchments where solution proposed result in LSE (Beneficial)
B1.1 Source control SUDS measures	244	190	77%
B1.2 Targeted source control SuDS measures at major opportunity areas	23	23	100%
B3.0 Property-level protection measures to prevent buildings from flooding	19	4	21%
C1.0 Intelligent sewer network to control flows	1	1	100%
C2.0 Proactive maintenance	1	1	100%
C4.0 Deep tank(s) and tunnel(s) to store combined sewage	244	244	100%
C5.0 Sewer lining to target infiltration hotspots	52	52	100%

C6.0 Transfer flows between catchments via existing connections	1	1	100%
C7.0 Transfer flows between catchments via new connections	1	1	100%
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	32	32	100%

Table 10-2 - Number of Catchments with LSE (Adverse) against GSO

GSO / Solution	No. of Catchments where GSO is promoted	No. of Catchments with LSE (Adverse)	Percentage of all Catchments where solution proposed result in LSE (Adverse)
B1.1 Source control SUDS measures	244	190*	77%
B1.2 Targeted source control SuDS measures at major opportunity areas	23	8*	34%
B3.0 Property-level protection measures to prevent buildings from flooding	19	0	0%
C1.0 Intelligent sewer network to control flows	1	0	0%
C2.0 Proactive maintenance	1	0	0%
C4.0 Deep tank(s) and tunnel(s) to store combined sewage	244	244	100%
C5.0 Sewer lining to target infiltration hotspots	52	0	0%
C6.0 Transfer flows between catchments via existing connections	1	0	0%
C7.0 Transfer flows between catchments via new connections	1	1	100%
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	32	23	72%

* Likely significant adverse effects identified during construction only.

The following section provides summaries of the findings, highlighting significant beneficial and adverse effects identified across the SEA Objectives with respect to the catchments and the GSOs promoted within them. Owing to the large number of options and catchments covered under this assessment, it is not possible to identify and discuss the characteristics of each catchment in turn. This information is presented within respective Location proformas, attached as Volume 3. Detail on the interrelationship anticipated between individual GSOs and SEA Objectives are discussed in the Magnitude of Impact proformas attached as Volume 2 Appendix C. These should be consulted for further information.

10.1.1. B1.1 Source Control SuDS

10.1.1.1. Significant Beneficial effects

Of the 244 catchments where GSO B1.1 has been proposed, it is clear that implementation of source control SuDS measure has the potential to provide significant benefits across a majority (77%) of these catchments. While no Major Beneficial effects have been identified, Moderate beneficial effects for over 50 catchments are anticipated against Objectives 1 – 6, 9 and 11 (covering topics of Biodiversity, Population and Human health, Material Assets, Water and Landscape/Townscape). Moderate beneficial effects are also identified for a smaller number of catchments (18) against Objective 7 (Soil) and for a single catchment (Newbury STW) against Objective 10 (Historic Environment).

The assessment has shown that the benefits anticipated largely stem from reduced capacity pressures on wastewater networks, wastewater resources and, consequently, reduced flooding events (including out of sewer flooding). In catchments that are highly sensitive in respect of population, biodiversity and water, such consequences have the potential to return the greatest benefits. For catchments particularly sensitive in respect of landscape, soil and historic environment, reduced flooding, soil erosion and amenity impacts (e.g. installation of green roofs) also contribute to tangible benefits within the respective catchments. Importantly, these effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.1.1.2. Significant Adverse effects

Significant adverse effects are anticipated in 77% of the catchments where GSO B1.1 is proposed. While no Strong Adverse effects have been identified, Moderate adverse effects for over 50 catchments are anticipated

against Objectives 1 – 6, 9 and 11 (covering topics of Biodiversity, Population and Human health, Material Assets and Water). In addition, Moderate adverse effects are also identified for a smaller number of catchments (33) against Objective 8 (Air and Climate). A further 18 catchments are anticipated to result in significant adverse effects when assessed against Objective 7 (Soil) and a single catchment (Newbury STW) against Objective 10 (Historic Environment).

The assessment has, however, shown that the adverse effects identified are, in every case, temporary to the construction phase and are therefore likely reversible. For example, with respect to air quality it is anticipated that implementation of SuDS measures may result in short to medium-term pollution and/or dust emissions owing to activities associated with their construction including the use of heavy plant and machinery. In catchments that are particularly sensitive to air quality changes (e.g catchments that contain an AQMA), such effects will be magnified. In respect of each SEA Objective, adverse effects associated with GSO B1.1 have been considered short to medium-term, reversible and limited to the construction phase. Such effects will not persist in the operational phase of this option.

10.1.1.3. Mitigation

Mitigations in respect of GSO B1.1 should aim to capitalise on the benefits identified, whether this be through integrating design features that maximise biodiversity gains, strengthen flood protections or engender public connections with the natural environment. As evident from the assessment, Source Control SuDS measures present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments that can expect to gain most benefit. See Volume 2 Appendix D for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within catchment, water and air quality impacts. While it is important to stress that the adverse impacts identified in respect of GSO B1.1 are all temporary to the construction phase, design (including site selection) and construction should seek to minimise as far as reasonably practical such disruptions, particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix D for further details.

Table 10-3 – Number of Catchments identified with LSE against each Objective B1.1

GSO Description: B1.1: Source Control SuDs measures

Installation of surface water management devices to collect, store and infiltrate surface water from buildings and surrounding impermeable areas such as driveways and car parks. This option includes residential properties, schools and other public buildings, commercial and industrial buildings.

Installation of surface water management devices to collect, store and infiltrate surface water from roads, pavements and pedestrianised areas.

--	79	79	110	53	53	53	18	33	68	1	100

10.1.2. B1.2 Targeted source control SuDS at major opportunity areas

10.1.2.1. Significant Beneficial effects

Significant beneficial effects have been identified in each of the 23 catchments where GSO B1.2 has been proposed. This is in respect of Water (Objective 6) and Climate (Objective 9) topics and includes major beneficial effects for the Kempsford and Hambleden Catchments against Objective 6. Moderate beneficial effects have also been identified for seven catchments against Objective 11 Landscape. Applying to a much smaller number of catchments, moderate beneficial effects have also been identified at New Mill catchment for Biodiversity (Objectives 1 and 2), at Dagnall catchment for Population and Human health (Objective 3), at Kempsford and Hambleden catchments for Objective 5 (Water) and at Hambleden catchment against Objective 7 (Soils).

The assessment has shown that the benefits anticipated largely stem from improved capacity in the network and therefore reduced capacity pressures on wastewater networks. This then has consequent benefits to reduced flood risk (including out of sewer flooding) and increased resilience to climate change. Implementation of SuDS also has the potential to engender connections with the natural environment and increase green infrastructure. Of note, these effects are in each case anticipated during the operational phase and are therefore long term, permanent in duration.

10.1.2.2. Significant Adverse effects

Moderate adverse effects have been identified across seven Objectives in a small number of catchments. In respect of biodiversity, moderate adverse effects have been identified for New Mills catchment. Dagnall catchment is anticipated to result in moderate adverse effects for Objectives 3 and 11 (Population and Human health and Landscape). With respect to water objectives (Objectives 5 and 6), moderate adverse effects have been identified for the Kempsford and Hambleden catchments. Hambleden catchment is also attributed moderate adverse effects in respect of Objectives 7 and 11 (Soils and Landscape). Finally, in respect of Objective 11 Landscape, moderate adverse effects are also anticipated at Chadlington, Chapel Row, Warmington, Combe and Beenham catchments.

The assessment has, however, shown that the adverse effects identified are, in every case, temporary to the construction phase and are therefore likely reversible.

While impact magnitude is increased across a range of biodiversity, material assets, soils, and landscape objectives, these impacts are associated with construction impacts, resulting in short to medium-term loss or damage. In respect of biodiversity for example, while creation of large scale surface water management strategies is likely to require significant construction works, resulting in potential fragmentation, damage or loss of habitat, disturbance to species and other impacts including noise and dust generation, these impacts are not anticipated during operation. Habitat is expected to re-establish over time and has the potential to be of improved quality than that previous.

10.1.2.3. Mitigation

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, impact on material assets, soils and landscape. Mitigations may include the provision of compensatory habitat, integration of recreational/amenity space, protection of soils and addition of landscaping features to mitigate visual impact of schemes.

While it is important to stress that the adverse impacts identified in respect of GSO B1.2 are all temporary to the construction phase, design (including site selection) and construction should seek to minimise as far as reasonably practical such disruptions, particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix D for further details.

Table 10-4 – Number of Catchments identified with LSE against each Objective B1.2

10.1.3. B3.0 Property-level protection measures to prevent buildings from flooding

Table 10-5 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.3.1. Significant Beneficial effects

Of the 19 catchments where GSO B3.0 has been proposed, implementation of property-level protection measures to prevent buildings from flooding has the potential to provide significant benefits for just over 1/5 of these catchments. While no Major Beneficial effects have been identified, Moderate beneficial effects for four catchments (Elstead STW, Stone STW, Wisley STW and Markyate STW) are anticipated against Objective 3 (Population and Human health).

Moderate beneficial effects are also identified against Elstead STW catchment for Objectives relating to Material Assets (Objective 4), Flood Risk (Objective 6) and Climate Change (Objective 9). Finally, Moderate beneficial effects have been identified against Wisley STW catchment in respect of Material Assets (Objective 4).

These catchments have been highlighted in the assessment owing to their increased sensitivity to population and human health, flood risk, climate change and material assets. Property-level protection measures to prevent flooding will reduce the risk of loss and damage to property and other assets, increase resilience in flood prone areas and reduce pressures on health and wellbeing where the number of out of sewer flooding incidents impacting on properties is reduced. These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.1.3.2. Significant Adverse effects

Within the 19 catchments promoting GSO B3.0, no significant adverse effects have been identified. The assessment has shown that adverse effects across the SEA topics are considered negligible, including during construction. Nevertheless construction / installation works should aim to reduce disturbance as far as reasonably practical. Close communication should also take place with property owners / tenants to help ensure that they understand the need for such measures and how best these measures can be utilised or managed during a storm / flood event.

10.1.3.3. Mitigation

Mitigations in respect of GSO B3.0 should aim to capitalise on the benefits identified within the proposed catchments. Minor beneficial effects have been identified in respect of the 15 remaining catchments where GSO B3.0 is proposed and without significant beneficial effects (Chilton, Cuddesdon, Guiting Power, Headley, Horton-Cum-Studley, Ironsbottom, Ratley, Sandford St Martin, Selborne, Stanton St John, Towersey, Willingale, Lewknor, Lower Basildon and Mollington STW catchments). Maximising these benefits will be achieved through careful site selection and early consultation with local communities and residents affected by flooding. See Volume 2 Appendix D for further details on significance attributed to each catchment where GSO B3.0 is proposed.

Table 10-5 – Number of Catchments identified with LSE against each Objective B3.0

GSO Description: B3.0 Property-level protection measures to prevent buildings from flooding

Provide vulnerable homes with passive flood protection measures such as flood proof doors and/or provide vulnerable homes with active property flood resilience measures such as self-sealing bath/shower systems (non-return valves). Active measures could also include the installation of FLIPs devices.

Temporary raised barriers erected in response to flood predictors in order to create a flow retention storage volume to avoid damage to property.

Increase thresholds of commercial properties to protect from more severe floods (future-proof).

Develop and build partnerships with strategic asset owners and operators to provide resilient flood protection measures.

Develop and build partnerships with property developers, product suppliers and the insurance industry to provide a framework for offering high quality affordable property flood protection measures.

10.1.4. C1.0 Intelligent sewer network to control flows

Table 10-6 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.4.1. Significant Beneficial effects

GSO C1.0 has been proposed in Slough STW catchment only. Implementation of this measure here will likely result in significant beneficial effects across a range of SEA Objectives. While no Major Beneficial effects have been identified, Moderate beneficial effects are anticipated against Objectives 1, 4-6 and 9 (covering topics of Biodiversity, Material Assets, Water and Climate change).

The assessment has shown (refer to the C1.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with implementation of intelligent sewer network flow control measures surround a potential reduction in flooding and overflows, with consequential benefits for biodiversity, material assets, the water environment and climate. Of note in Slough STW catchment there are three internationally designated sites, four nationally designated sites and three locally designated sites. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of three DWSZ, there are also five areas of SPZ, and 30 rivers/waterbodies/tributaries within the catchment. Two Communities at Risk Areas, 68 Flood Warning Areas and 36 Flood Alert Areas have been identified within the catchment and contribute to increased sensitivity in respect of Flood Risk.

10.1.4.2. Significant Adverse effects

No significant adverse effects have been identified for this GSO within the Slough STW catchment. The assessment has shown that adverse effects across the SEA topics are considered negligible, including during construction. Therefore, sensitivity of the catchment becomes less of a constraint owing to the negligible construction and operational impacts anticipated. Nevertheless, any minor construction or installation works associated with this option should aim to reduce disturbance as far as reasonably practical.

10.1.4.3. Mitigation

No specific mitigations recommended.

Table 10-6 – Number of Catchments identified with LSE against each Objective C1.0

GSO Description: Solution C1.0 Intelligent sewer network to control flows											
Active System Management (ASM) at key points in the network to optimise available network capacity by balancing network flows. E.g. Automation of weir chambers on trunk sewers. Requires deployment of sewer monitors for live/predictive modelling.											
Active system management at key pumping stations across the network to optimise available network capacity by balancing network flows. Requires deployment of sewer monitors for live/predictive modelling.											
Ability to monitor and control flow at pipe/chamber level.											
Integrate energy and cost monitoring from operational sites into active system management decision-making process.

10.1.5. C2.0 Proactive maintenance

Table 10-7 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.5.1. Significant Beneficial effects

GSO C2.0 has been proposed in Maple Lodge STW catchment only. Implementation of this measure will likely result in significant beneficial effects across a range of SEA Objectives. While no Major Beneficial effects have been identified, Moderate beneficial effects are anticipated against Objectives 1 and 3-6 (covering topics of Biodiversity, Population and human health, Material Assets and Water).

The assessment has shown (refer to the C2.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that benefits associated with implementation of proactive maintenance surround a potential reduction in flooding (including out of sewer flooding), overflows and increased network efficiency, with consequential benefits for biodiversity, health and wellbeing, material assets and the water environment. Of note in Maple Lodge STW catchment is that there is one internationally designated site, seven nationally designated sites and 23 locally designated sites. Also identified within the catchment are 1,262 areas utilised for recreation or which benefit the community, 224 areas where vulnerable population groups would be expected and 168 Noise Important Areas. In respect of Material Assets, a high proportion of the area is urbanised. High sensitivity is also reflected in the water environment through designation of eight DWSZ. There are also 24 areas of SPZ, and 115 rivers/waterbodies/tributaries within the catchment.

10.1.5.2. Significant Adverse effects

No significant adverse effects have been identified. The assessment has shown (refer to the magnitude of impact proforma located in Volume 2 Appendix C) that adverse effects across the SEA topics are considered negligible. Therefore, sensitivity of the catchment becomes less of a constraint owing to the negligible adverse construction and operational impacts anticipated.

10.1.5.3. Mitigation

No specific mitigations recommended.

	0	0	0	0	0	0	0	0	0	0	0
	0	0	0	0	0	0	0	0	0	0	0

10.1.6. C4.0 Deep tank(s) and tunnel(s) to store combined sewage

Table 10-8 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.6.1. Significant Beneficial effects

Each of the 244 catchments where GSO C4.0 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-8.

Major Beneficial effects have been identified against 81 of the 244 catchments for Objective 1 (Biodiversity). Of the 221 catchments, 51 are also attributed Major beneficial effects against Objective 5 (Water). In respect of Objective 1, each of the catchments have been attributed Major and Moderate beneficial effects. Similarly, in respect of Objective 5, each of the catchments have been attributed significant beneficial effects (Major or Moderate beneficial).

Moderate beneficial effects are also identified against over 100 catchments in respect of Objective 3 (Population and human health), Objective 4 (Material assets) and Objective 5 (water quality). Over 50 catchments might be expected to see Moderate beneficial effects in respect of issues of flood risk (Objective 6), climate change (Objective 9) and landscape/townscape (Objective 11). Finally, three catchments have been attributed Moderate beneficial effects against Objective 10 (Historic Environment).

The assessment has shown (refer to the C4.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that benefits anticipated stem from increased storage capacity, increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding). In catchments that are highly sensitive in respect of population, biodiversity, water, climate, material assets and heritage, reductions in flooding (including out of sewer flooding) have the potential to return the greatest benefits.

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.1.6.2. Significant Adverse effects

Significant adverse effects are anticipated in all of the catchments where GSO C4.0 is proposed. Major adverse effects have been identified against 18 catchments owing to increased sensitivity measured against Objective 7 (soils). Of note, all of the remaining catchments have been attributed Moderate adverse effects against this objective.

Moderate adverse effects have been identified for over 100 catchments in respect of Objectives 3 (Population and human health). In respect of Objectives 1 (Biodiversity), 4 (Material assets), 5 (Water quality), 6 (Flood risk), 8 (Air) and 11 (Landscape/townscape) over 50 catchments have been attributed with Moderate adverse effects. Three catchments have been attributed moderate adverse effects in respect of Objective 10 (Historic environment).

The assessment has shown that the adverse effects are, for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to install deep tanks and tunnels. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity, it is anticipated that construction of deep tanks and tunnels may result in short to medium-term loss or damage owing to the requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the areas impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potentially permanent loss or damage has been identified in respect of soil (Objective 7) and heritage (Objective 10) considerations. While the magnitude of loss/damage depends on the size of tanks and tunnels installed, alongside considerations including precise location, such interventions have the potential to result in the permanent loss or disturbance to soils, their quality and function, as well as to heritage assets such as Listed Buildings and Scheduled Monuments. Catchments that are particularly sensitive in respect of heritage considerations include Newbury STW catchment, Woodstock STW catchment and Church Hanborough STW catchment.

10.1.6.3. Mitigation

Mitigations in respect of GSO C4.0 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, deep tanks and tunnels present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments that can expect to gain most benefit. See Volume 2 Appendix D for further details.

Mitigations to address the significant adverse effects identified, largely associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors, water and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Permanent loss or damage to soils is a considerable risk associated with this option identified in each of the 244 catchments at either a Major or Moderate adverse significance. Such impacts can be mitigated through careful site selection (avoiding areas of best and most versatile soils) and pre-construction surveys such as soil classification surveys.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent), particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix D for further details.

Table 10-8 – Number of Catchments identified with LSE against each Objective C4.0

GSO Description: C4.0 Deep tank(s) and tunnel(s) to store combined sewage												
Deep tanks and tunnels to convey combined sewage to treatment location. Creates conveyance capacity for storm water.												
No. of Catchments where GSO is promoted		No. of Catchments with LSE (Beneficial)			No. of Catchments with LSE (Adverse)			Percentage of all Catchments where GSO proposed result in LSE				
244		244			244			100%				
Significance of Effect	SEA Objective											
	Objective 1: To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Objective 2: To strengthen the connections between people and nature and realise the value of biodiversity	Objective 3: To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Objective 4: To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Objective 5: To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Objective 6: To reduce and manage flood risk	Objective 7: To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Objective 8: To reduce air pollutant and greenhouse gas emissions	Objective 9: To adapt and improve resilience to the threats of climate change	Objective 10: To conserve and enhance the historic environment, the heritage assets therein and their setting	Objective 11: To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	
	+++	79	0	0	0	53	0	0	0	0	0	
	++	165	0	110	106	191	53	0	0	68	3	100
	+	0	0	0	0	0	0	18	0	0	0	0
--	79	0	110	55	53	51	226	33	0	3	100	

10.1.7. C5.0 Sewer lining to target infiltration hotspots

Table 10-9 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.7.1. Significant Beneficial effects

Each of the 52 catchments where GSO C5.0 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-9. Major Beneficial effects have been identified against 14 of the 52 catchments for Objective 4 (Material Assets), with the remaining 38 catchments being attributed Moderate Beneficial effects for this objective.

Moderate beneficial effects are also identified against 14 catchments in respect of Objective 6 (Flood Risk) and 19 catchments for Objective 9 (Climate Change).

The assessment has shown that the benefits associated with implementation of sewer lining to target infiltration hotspots surround a potential reduction in flooding (including out of sewer flooding) and increased network efficiency, with consequential benefits for material assets, flood risk and climate change.

10.1.7.2. Significant Adverse effects

No significant adverse effects have been identified. Review of the magnitude of impact proforma shows that adverse effects across the SEA topics are considered negligible. Therefore, sensitivity of the catchment becomes less of a constraint owing to the negligible adverse construction and operational impacts anticipated.

10.1.7.3. Mitigation

No specific mitigations recommended.

10.1.8. C6.0 Transfer flows between catchments via existing connections

Table 10-10 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.8.1. Significant Beneficial effects

GSO C6.0 has been proposed in Maple Lodge STW catchment only. Implementation of this measure here will likely result in significant beneficial effects across a range of SEA Objectives. While no Major Beneficial effects have been identified, Moderate beneficial effects are anticipated against Objectives 1-6 and 9 (covering topics of Biodiversity, Population and human health, Material Assets, Water and Climate Change).

The assessment has shown that benefits associated with the implementation of transfer flows between catchments via existing connections surround a potential reduction in flooding (including out of sewer flooding), overflows and reduced capacity pressures, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change. Of note in Maple Lodge STW catchment there is one internationally designated site, seven nationally designated sites and 23 locally designated sites. Also identified within the catchment are 1,262 areas utilised for recreation or which benefit the community, 224 areas where vulnerable population groups would be expected and 168 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of eight DWSZ, there are also 24 areas of SPZ, and 115 rivers/waterbodies/tributaries within the catchment. Seven Communities at Risk Areas, 20 Flood Warning Areas and 50 Flood Alert Areas have also been identified within the catchment.

10.1.8.2. Significant Adverse effects

No significant adverse effects have been identified. Review of the magnitude of impact proforma shows that adverse effects across the SEA topics are considered negligible. Therefore, sensitivity of the catchment becomes less of a constraint owing to the negligible construction and operational impacts anticipated.

10.1.8.3. Mitigation

No specific mitigations recommended.

Table 10-10 – Number of Catchments identified with LSE against each Objective C6.0

GSO Description: C6.0 Transfer flows between catchments via existing connections

Connections exist between the catchments and also between some of the STWs. These connections could be used to transfer flows between catchments without capacity to those with short term capacity.

10.1.9. C7.0 Transfer flows between catchments via new connections

Table 10-11 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.9.1. Significant Beneficial effects

GSO C7.0 has been proposed in Culham STW catchment only. Implementation of this measure here will likely result in significant beneficial effects across a range of SEA Objectives. While no Major Beneficial effects have been identified, Moderate beneficial effects are anticipated against Objectives 1, 3-6 and 9 (covering topics of Biodiversity, Population and human health, Material Assets, Water and Climate Change).

The assessment has shown (see the C7.0 Magnitude of Impact proforma in Volume 2 Appendix C) that the benefits associated with implementation of transfer flows between catchments via new connections surround a potential reduction in flooding (including out of sewer flooding), overflows, reduced capacity pressures and the opportunity for discovery of previously unknown heritage features, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment, climate change, cultural heritage and landscape. Of note in Culham STW catchment there are two internationally designated sites within 10km and one nationally designated site within 2km. Also identified within the catchment are 16 areas utilised for recreation or which benefit the community, three areas where vulnerable population groups would be expected and one Noise Important Area. High sensitivity is also reflected in the water environment through the designation of two DWSZ, there are also three rivers/waterbodies/tributaries within the catchment.

10.1.9.2. Significant Adverse effects

Moderate adverse effects have been identified in respect of Objectives 3 (Population and human health) and 7 (Soil).

The assessment has shown (refer to the C7.0 Magnitude of Impact proforma in Volume 2 Appendix C) that the adverse effects are, for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to install new connections. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity it is anticipated that construction of new connections may result in short to medium-term loss or damage owing to requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the areas impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potentially permanent loss or damage has been identified in respect of soil (Objective 7) considerations. While the magnitude of loss/damage depends on the size of new connections installed, alongside considerations including precise location, such interventions have the potential to result in the permanent loss or disturbance to soils, their quality and function. Of note is the presence of Grade 2 and 3 soils within Culham STW catchment.

10.1.9.3. Mitigation

Mitigations in respect of GSO C7.0 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, transfer flows between catchments via new connections present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in the catchment. See Volume 2 Appendix D for further details.

Mitigations to address the significant adverse effects identified are largely associated with the construction phase of works and should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors, water and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Permanent loss or damage to soils is a considerable risk. Such impacts can be mitigated through careful site selection (avoiding areas of best and most versatile soils) and pre-construction surveys such as soil classification surveys.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent. See Volume 2 Appendix D for further details.

Table 10-11 – Number of Catchments identified with LSE against each Objective C7.0

GSO Description: C7.0 Transfer flows between catchments via new connections

This option is about creating new connections between the STW catchments to optimise capacities and to find the best balance of flow and load i.e. removing catchment boundaries. It would allow utilisation of the short term capacity in some STWs whilst other STWs are expanded or redeveloped.

Similar to the London Water Ring Main this could be a large infrastructure project that would allow most/all catchments to discharge into a single infrastructure pipe/tunnel and then allow any or all of the STWs to extract from this ring main and treat the flows. Reliant on availability of suitable STWs - London may be the only possible location for such a strategic option

No. of Catchments where GSO is promoted	No. of Catchments with LSE (Beneficial)	No. of Catchments with LSE (Adverse)	Percentage of all Catchments where GSO proposed result in LSE

10.1.10. D3.0 Replace/retrofit/expand existing primary/secondary treatment processes

Table 10-12 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.10.1. Significant Beneficial effects

Each of the 32 catchments where GSO D3.0 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-12. Major Beneficial effects have been identified against five catchments (Chertsey, Chobham, East Hyde, Tring and Leatherhead) for Objective 4 (Material Assets), with the remaining 27 catchments all being identified as having Moderate Beneficial effects for this objective.

Moderate beneficial effects are anticipated in at least 10 catchments against Objectives 1-3 (covering topics of Biodiversity and Population and human health). Moderate beneficial effects are also anticipated in four catchments (Chertsey, East Hyde, Dorking and Leatherhead) for Objective 5 (Water Quality) and Objective 6 (Flood Risk) and for eight catchments against Objective 9 (Climate Change).

The assessment has shown (refer to the D3.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with replacing, retrofitting or expanding existing primary or secondary treatment processes surround a potential reduction in flooding (including out of sewer flooding), overspill and improved capacity, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change.

10.1.10.2. Significant Adverse effects

72% of the catchments where GSO D3.0 is proposed are anticipated to result in significant adverse effects. While no Major Adverse effects have been identified, Moderate adverse effects for over 10 catchments are anticipated against Objectives 1 (Biodiversity), 3 (Population and human health) and 11 (Landscape). Moderate adverse effects have been identified in respect of Objective 4 (Material Assets) for five catchments (Chertsey, Chobham, East Hyde, Tring and Leatherhead), and for Objectives 5 and 6 (The Water Environment) against four catchments (Chertsey, East Hyde, Dorking and Leatherhead). Chertsey and Dorchester are also considered Moderate adverse in respect of Objective 7 (Soils) and Chertsey, Appleton, East Hyde and Leatherhead are considered Moderate adverse against Objective 9 (Climate change).

The assessment has shown (refer to the D3.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the adverse effects are, for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to replace, retrofit or expand existing treatment works. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to the water environment it is anticipated that replacing, retrofitting or expanding existing primary or secondary treatment processes may result in short to medium-term loss or effects to water quality or flood risk. It should be possible to restore much of the areas impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potentially permanent loss or damage has been identified in respect of biodiversity (Objective 1) and soil (Objective 7) considerations. While the magnitude of loss/damage depends on the extent of works, alongside considerations including precise location, such interventions have the potential to result in the permanent loss or disturbance to soils, their quality and function.

10.1.10.3. Mitigation

Mitigations in respect of GSO D3.0 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity or increase resilience to extreme weather events (flooding). As evident from assessment, transfer flows between replacing, retrofitting or expanding existing primary or secondary treatment processes, presents significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in the catchments. See Volume 2 Appendix D for further details.

Mitigations to address the significant adverse effects identified largely associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors, water and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Permanent loss or damage to soils is a considerable risk associated with this option identified at Moderate adverse significance. Loss or damage to heritage assets and biodiversity are also key considerations owing to the permanence of the impact. Such impacts can be mitigated through careful site selection (avoiding areas of increased heritage value and best and most versatile soils), pre-construction surveys such as soil classification surveys, archaeological trenching and supervision of works, and consideration of the timing of construction works in relation to ecological windows.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix D for further details.

Table 10-12 – Number of Catchments identified with LSE against each Objective D3.0

GSO Description: D3.0 Replace/retrofit/expand existing primary/secondary treatment processes

Chemically Assisted Primary Sedimentation (CAPS), Dissolved Air Flotation, Lamellas, and sand ballasted primary treatment are some of the 5+ methods of getting more intensive Primary treatment from a smaller area of land than traditional processes. There are a range of different technologies that have been identified for increasing the intensity of secondary treatment processes at the STW either with retrofitting or new build e.g. modular stacked treatment processes.

10.1.11. C3.1 Increased network capacity by installing larger sewers

Table 10-13 identifies the significant effects (both beneficial and negative) against each of the SEA Objectives.

10.1.11.1. Significant Beneficial effects

Slough STW catchment, where GSO C3.1 has been proposed, is likely to result in significant beneficial effects, as shown in Table 10-13.

Major Beneficial effects have been identified against Slough STW catchment for Objective 1 (Biodiversity) and Objective 6 (Flood Risk).

Moderate beneficial effects are identified in Slough STW catchment in respect of Objective 2 – 5 and 9 (covering topics of Biodiversity, Population and human health, Material Assets, and Climate).

The assessment has shown (refer to the C3.1 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits anticipated stem from increased capacity, increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding).

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.1.11.2. Significant Adverse effects

In Slough STW catchment where GSO C3.1 is proposed, significant adverse effects are anticipated. Major adverse effects have been identified, owing to increased sensitivity measured against Objective 7 (soils).

Moderate adverse effects have been identified in respect of Objectives 1 (Biodiversity), 3 - 6 (Population and human health, Material assets and Water) and 8 (Air).

The assessment has shown (refer to the C3.1 Magnitude of Impact proforma located in Volume 2 Appendix C) that these adverse effects are, for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to install larger sewers. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity, it is anticipated that installation of larger sewers may result in short to medium-term loss or damage owing to the requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the area impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potentially permanent loss or damage has been identified in respect of soil (Objective 7) considerations. While the magnitude of loss/damage depends on considerations such as precise location, this intervention has the potential to result in the permanent loss or disturbance to soils, their quality and function for those areas deemed to be of increased sensitivity.

10.1.11.3. Mitigation

Mitigations in respect of GSO C3.1 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced sewer overflows in recreational waters. As evident from assessment, larger sewers present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments that can expect to gain most benefit. See Volume 2 Appendix D for further details.

Mitigations to address the significant adverse effects identified largely associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors, landscape and air quality impacts.

Permanent loss or damage to soils is a considerable risk identified as a Major adverse significance in Slough STW catchment. Such impacts can be mitigated through careful site selection (avoiding areas of best and most versatile soils) and pre-construction surveys such as soil classification surveys.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent), particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix D for further details.

10.2. London Catchment and LRZ Solutions

Table 10-14 and Table 10-15 display the percentages of catchments where GSOs result in either significant beneficial or adverse Likely Significant Effects (LSE). The tables show that all GSOs are expected to result in significant beneficial effects across all catchments/LRZs. Of the 18 GSOs promoted in at least one London catchment or LRZ, 14 of the GSOs are expected to result in significant adverse effects across all of the catchments or LRZ.

Table 10-14 – Number of London Catchments and LRZs with LSE (Beneficial) against GSO

GSO	No. of London Catchments and LRZs where GSO is promoted	No. of London Catchments and LRZs with LSE (Beneficial)	Percentage of all London Catchments and LRZs where solution proposed result in LSE (Beneficial)

* Likely significant adverse effects identified during construction only.

The following section provides summaries of the findings, highlighting significant beneficial and adverse effects identified across the SEA Objectives with respect to the catchments and London Risk Zones and the GSOs

promoted within them. Owing to the large number of options and catchments covered under this assessment, it is not possible to identify and discuss the characteristics of each catchment/LRZ in turn. This information is presented within respective Location proformas, attached as Volume 3. Detail on the interrelationship anticipated between individual GSOs and SEA Objectives are discussed in the Magnitude of Impact proformas attached as Volume 2 Appendix C. These should be consulted for further information.

10.2.1. B1.1 Source Control SuDS

Table 10-16 identifies the number of London catchments and LRZs with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.1.1. Significant Beneficial effects

Each of the 37 areas where GSO B1.1 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-16. No Major Beneficial effects have been identified. Moderate beneficial effects are identified for over 20 of the areas against Objectives 1 – 6 and 9 (covering topics of Biodiversity, Population and Human health, Material Assets and Water). Moderate beneficial effects are also identified against eight areas in respect of Objective 7 (Soil), seven areas against Objective 11 (Landscape) and for a single catchment (Deephams STW) against Objective 10 (Historic Environment).

The assessment has shown (refer to the B1.1 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits anticipated largely stem from reduced capacity pressures on wastewater networks, wastewater resources and, consequently, reduced flooding events (including out of sewer flooding). In catchments and London Risk Zones that are highly sensitive in respect of population, biodiversity and water, such consequences have the potential to return the greatest benefits. For catchments and London Risk Zones particularly sensitive in respect of landscape, soil and historic environment, reduced flooding, soil erosion and amenity impacts (e.g. installation of green roofs) also contribute to tangible benefits within the respective areas. Importantly, these effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.2.1.2. Significant Adverse effects

All of the catchments and London Risk Zones where GSO B1.1 is proposed are anticipated to result in significant adverse effects. While no Major Adverse effects have been identified, Moderate adverse effects for over 20 areas are anticipated against Objectives 1 – 6, 8 and 9 (covering topics of Biodiversity, Population and Human health, Material Assets, Air and Climate and Water). In addition, Moderate adverse effects are also identified against eight areas in respect of Objective 7 (Soil). Seven areas are anticipated to result in significant adverse effects when assessed against Objective 11 (Landscape) and a single catchment (Deephams STW) against Objective 10 (Historic Environment).

The assessment has shown (refer to the B1.1 Magnitude of Impact proforma located in Volume 2 Appendix C) that these adverse effects identified are, in every case, temporary to the construction phase and are therefore reversible. For example, with respect to air quality it is anticipated that implementation of SuDS measures may result in short to medium-term loss or damage owing to activities associated with their construction including the use of heavy plant and machinery. In areas that are particularly sensitive to air quality changes (e.g by containing an AQMA), such effects will be magnified. In respect of each SEA Objective, adverse effects associated with GSO B1.1 have been considered short to medium-term, reversible and limited to the construction phase. Such effects will not persist in the operational phase of this option.

10.2.1.3. Mitigation

Mitigations in respect of GSO B1.1 should aim to capitalise on the benefits identified, whether this be through integrating design features that maximise biodiversity gains, strengthen flood protections or engender public connections with the natural environment. As evident from assessment, Source Control SuDS measures present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments and London Risk Zones that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within the catchments and London Risk Zones, water and air quality impacts. While it is important to stress that the adverse impacts identified in respect of GSO B1.1 are all temporary to the construction phase, design (including site selection) and construction should seek to minimise as far as reasonably practical such disruptions, particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix E for further details.

Table 10-16 – Number of London Catchments and LRZs identified with LSE against each Objective B1.1

GSO Description: B1.1 Source Control SuDs measures

Installation of surface water management devices to collect, store and infiltrate surface water from buildings and surrounding impermeable areas such as driveways and car parks. This option includes residential properties, schools and other public buildings, commercial and industrial buildings.

Installation of surface water management devices to collect, store and infiltrate surface water from roads, pavements and pedestrianised areas.

	--	27	27	36	31	21	21	8	27	34	1	7

10.2.2. B1.2 Targeted source control SuDS measures at major opportunity areas

Table 10-17 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.2.1. Significant Beneficial effects

Each of the 37 catchments and London Risk Zones where GSO B1.2 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-17. Major Beneficial effects have been identified against Objective 6 (Flood Risk) for 15 areas and Objective 9 (Climate) for 23 areas. The remaining areas are anticipated to have moderate beneficial effects for Objectives 6 and 9. Moderate beneficial effects are identified for 20 or more areas against Objectives 1 – 4 (covering topics of Biodiversity, Population and Human health, Material Assets). Additionally, moderate beneficial effects were identified for 15 areas against Objective 5 (Water), six areas against Objective 7 (Soil), four areas against Objective 11 (Landscape) and for a single catchment (Deephams STW) against Objective 10 (Historic Environment).

The assessment has shown (refer to the B1.2 Magnitude of Impact proforma in Volume 2 Appendix C) that the benefits anticipated largely stem from reduced capacity pressures on wastewater networks, wastewater resources and, consequently, reduced flooding events (including out of sewer flooding). In catchments and London Risk Zones that are highly sensitive in respect of population, biodiversity and water, such consequences have the potential to return the greatest benefits. For areas particularly sensitive in respect of landscape, soil and historic environment, reduced flooding, soil erosion and amenity impacts (e.g. installation of green roofs) also contribute to tangible benefits within the respective catchments and London Risk Zones. Importantly, these effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.2.2.2. Significant Adverse effects

As with the significant beneficial effects, all areas where GSO B1.2 is proposed are also anticipated to result in significant adverse effects. While no Major Adverse effects have been identified, Moderate adverse effects for 20 or more catchments and London Risk Zones are anticipated against Objectives 1 – 4, 8 and 9 (covering topics of Biodiversity, Population and Human health, Material Assets, Air and Climate). For Objective 5 and 6 (Water) moderate adverse effects are anticipated for 15 areas. In addition, Moderate adverse effects are also identified for six areas against Objective 7 (Soil). Four areas are anticipated to result in significant adverse effects when assessed against Objective 11 (Landscape) and a single catchment (Deephams STW) against Objective 10 (Historic Environment).

The assessment has however shown (refer to the B1.2 Magnitude of Impact proforma in Volume 2 Appendix C) that the adverse effects identified are, in every case, temporary to the construction phase and are therefore reversible. For example, with respect to air quality it is anticipated that implementation of SuDS measures in major opportunity areas may result in short to medium-term loss or damage owing to activities associated with their construction including the use of heavy plant and machinery. In catchments and London Risk Zones that are sensitive to and suffer from air quality pressures (e.g. they contain an AQMA), such effects are likely to be of increased significance. In respect of each SEA Objective, adverse effects associated with GSO B1.2 have been considered short to medium-term, reversible and limited to the construction phase. Such effects will not persist in the operational phase of this option.

10.2.2.3. Mitigation

Mitigations in respect of GSO B1.2 should aim to capitalise on the benefits identified, whether this be through integrating design features that maximise biodiversity gains, strengthen flood protections or engender public connections with the natural environment. As evident from assessment, Targeted Source Control SuDS measures at major opportunity areas present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments and London Risk Zones that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within catchment, water and air quality impacts. While it is important to stress that the adverse impacts identified in respect of GSO B1.2 are all temporary to the construction phase, design (including site selection) and construction should seek to minimise as far as reasonably practical such disruptions, particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix E for further details.

--	20	20	24	22	15	15	6	20	23	1	4

10.2.3. B2.1 Combined sewer separation (parallel foul sewer network)

Table 10-18 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.3.1. Significant Beneficial effects

Each of the two catchments (Beckton STW and Crossness STW) where GSO B2.1 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-18. Major Beneficial effects have been identified against Objectives 1 and 4 – 6 (Biodiversity, Material Assets and Water) for both catchments. Moderate beneficial effects are identified for both catchments against Objectives 2, 3 and 9 (covering topics of Biodiversity, Population and Human health and Climate).

The assessment has shown (refer to the B2.1 Magnitude of Impact proforma in Volume 2 Appendix C) that the benefits associated with converting existing combined sewers to surface water only and constructing new foul water sewers surround a potential reduction in flooding (including out of sewer flooding) and improved capacity, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change. Of note in Beckton STW there are three internationally designated sites, six nationally designated sites and 24 locally designated sites. Also identified within the catchment are 3,208 areas utilised for recreation or which benefit the community, 725 areas where vulnerable population groups would be expected and 331 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of one DWSZ, there are also 27 areas of SPZ, and 64 rivers/waterbodies/tributaries within the catchment. 15 Communities at Risk Areas, 38 Flood Warning Areas and 62 Flood Alert Areas have also been identified within the catchment. In Crossness STW there are two internationally designated sites, five nationally designated sites and 33 locally designated sites. In regard to Population and Human health in Crossness STW, 2,511 areas utilised for recreation or which benefit the community, 510 areas where vulnerable population groups would be expected and 209 Noise Important Areas have been identified. In respect of Material Assets, a high percentage of the areas are urbanised. High sensitivity is also reflected in the water environment through designation of one DWSZ, there are also 9 areas of SPZ, and 33 rivers/waterbodies/tributaries within the catchment. 107 Communities at Risk Areas, 45 Flood Warning Areas and 28 Flood Alert Areas have also been identified within the catchment.

10.2.3.2. Significant Adverse effects

Significant adverse effects have been identified in both Beckton and Crossness STW catchments. While no Major Adverse effects have been identified, Moderate adverse effects for both catchments are anticipated against Objectives 1, 3 – 6 and 8 (covering topics of Biodiversity, Population and Human health, Material Assets and Air).

The assessment has however shown (refer to the B2.1 Magnitude of Impact proforma in Volume 2 Appendix C) that these adverse effects identified are, for the most part, temporary to the construction phase and are therefore likely reversible. Heavy engineering and construction works are likely to be required to convert existing sewers and construct new foul water sewers. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity it is anticipated that construction of new connections may result in short to medium-term loss or damage owing to the requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the areas impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works. In Beckton STW and Crossness STW the receptors causing high sensitivity in regard to Biodiversity, Population and Human health and Material Assets are outlined above. Construction has the potential to add pressure to local air quality issues. Of note high sensitivity in respect of in air quality in Beckton STW is associated with the designation of 17 AQMAs, 37 nature conservation sites and 681 sensitive receptors within the catchment. In Crossness STW there are 14 AQMAs, 9 nature conservation sites and 452 sensitive receptors.

10.2.3.3. Mitigation

Mitigations in respect of GSO B2.1 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, Combined

sewer separation through parallel foul sewer networks present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within catchment, water and air quality impacts.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent. See Volume 2 Appendix E for further details.

	--	2	0	2	2	2	2	0	2	0	0	0

10.2.4. B2.2 Combined sewer separation. Construct new surface water sewers

Table 10-19 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.4.1. Significant Beneficial effects

Significant beneficial effects have been identified across each of the five areas (Beckton STW, Crossness STW and Crossness London Risk Zones (Wandsworth, Southwark and Lewisham)) where GSO B2.2 has been proposed, as shown in Table 10-19. Major Beneficial effects have been identified against Objective 4 (Material Assets) for all five areas. Additionally, major beneficial effects have been identified against Objectives 1, 5 and 6 (Biodiversity and Water) for Beckton STW, Crossness STW and Wandsworth LRZ, with the remaining two LRZs having moderate beneficial effects for each of these objectives. Moderate beneficial effects are identified for all areas against Objectives 3 and 9 (covering topics of Population and Human health and Climate) and three areas (Beckton STW, Crossness STW and Wandsworth LRZ) have been identified as having moderate beneficial effects for Objective 2 (Biodiversity).

The assessment has shown (refer to the B2.2 Magnitude of Impact proforma in Volume 2 Appendix C) that the benefits associated with constructing new surface water sewers surround a potential reduction in flooding (including out of sewer flooding) and improved capacity, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change.

10.2.4.2. Significant Adverse effects

Significant adverse effects have been identified across each of the five areas where GSO B2.1 is proposed. While no Major Adverse effects have been identified, Moderate adverse effects for all areas are anticipated against Objectives 3 and 4 (covering topics of Population and Human health and Material Assets). Additionally, moderate adverse effects are anticipated for Objectives 1, 5, 6 and 8 (covering topics of Biodiversity, Water and Climate) in three of the areas (Beckton STW, Crossness STW and Wandsworth LRZ).

The assessment has however shown (refer to the B2.2 Magnitude of Impact proforma in Volume 2 Appendix C) that these adverse effects identified are, for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to construct new surface water sewers. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity it is anticipated that construction of new connections may result in short to medium-term loss or damage owing to the requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the areas impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

From review of the B2.2 Magnitude of Impact proforma however, these adverse effects identified are, in every case, temporary to the construction phase and are therefore reversible. Significant adverse effects will not persist in the operational phase of this option.

10.2.4.3. Mitigation

Mitigations in respect of GSO B2.2 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, Combined sewer separation through construction of new surface water sewers presents significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in areas that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within catchment, water and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix E for further details.

10.2.5. B2.3 Disconnect existing surface water systems from combined sewers and discharge to watercourse

Table 10-20 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.5.1. Significant Beneficial effects

Each of the 2 areas, Beckton STW (catchment) and Beckton STW - NW(Newham) (London Risk Zone), where GSO B2.3 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-20. Major Beneficial effects have been identified against Objectives 1 and 4 (Biodiversity and Material Assets) for both areas. Moderate beneficial effects are identified for both areas against Objectives 2, 3, 5, 6 and 9 (covering topics of Biodiversity, Population and Human health, Water and Climate).

The assessment has shown (refer to the B2.1 Magnitude of Impact proforma in Volume 2 Appendix C) that the benefits associated with disconnecting existing surface water systems from combined sewers and discharging to watercourses surround a potential reduction in flooding (including out of sewer flooding) and improved capacity, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change. Of note in Beckton STW are three internationally designated sites, six nationally designated sites and 24 locally designated sites. Also identified within the catchment are 3,208 areas utilised for recreation or which benefit the community, 725 areas where vulnerable population groups would be expected and 331 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of one DWSZ, there are also 27 areas of SPZ, and 64 rivers/waterbodies/tributaries within the catchment. 15 Communities at Risk Areas, 38 Flood Warning Areas and 62 Flood Alert Areas have also been identified within the catchment. In Beckton STW - NW(Newham) are three internationally designated sites, four nationally designated sites and 4 locally designated sites. Also identified within this London Risk Zone are 1,198 areas utilised for recreation or which benefit the community, 254 areas where vulnerable population groups would be expected and 95 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of one DWSZ, there are also 16 areas of SPZ, and 57 rivers/waterbodies/tributaries within the Risk Zone. 8 Communities at Risk Areas, 26 Flood Warning Areas and 52 Flood Alert Areas have also been identified within Beckton STW - NW(Newham).

10.2.5.2. Significant Adverse effects

Significant adverse effects are anticipated in both of the areas where GSO B2.3 is proposed. While no Major Adverse effects have been identified, Moderate adverse effects for Beckton STW (catchment) and Beckton STW - NW(Newham) (London Risk Zone) are anticipated against Objectives 1, 3 – 6 and 8 (covering topics of Biodiversity, Population and Human health, Material Assets and Air).

The assessment has however shown (refer to the B2.1 Magnitude of Impact proforma in Volume 2 Appendix C) that these adverse effects identified are, for the most part, temporary to the construction phase and are therefore reversible. Construction works are likely to be required to disconnect existing sewers. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to air quality it is anticipated that disconnecting existing sewers may result in short to medium-term loss or damage owing to activities associated with their construction including the use of heavy plant and machinery. In areas that are particularly sensitive to air quality changes (e.g. by containing an AQMA), such effects will be magnified. In respect of each SEA Objective, adverse effects associated with GSO B2.3 have been considered short to medium-term, reversible and limited to the construction phase. Such effects will not persist in the operational phase of this option. In Beckton STW and Beckton STW - NW(Newham) the receptors causing high sensitivity in regard to Biodiversity, Population and Human health and Material Assets are outlined above. High sensitivity is reflected in air quality in Beckton STW with the designation of 17 AQMAs, 37 nature conservation sites and 681 sensitive receptors within the catchment. Similarly, in Beckton STW - NW(Newham) there are 10 AQMAs, 34 nature conservation sites and 718 sensitive receptors.

While the magnitude of loss/damage depends on the extent of works, alongside considerations including precise location and receiving watercourses, this intervention has the potential to result in increased pressures on biodiversity including aquatic biodiversity and to water quality where diverting potentially contaminated surface waters (including urban runoff) is anticipated.

10.2.5.3. Mitigation

Mitigations in respect of GSO B2.3 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, disconnecting existing sewers presents significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in areas that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within catchment, water and air quality impacts. This may be achieved through implementation of Construction Environmental Management Plans that addresses issues of water quality, biodiversity, noise and dust. Operational impacts from the diversion of surface water runoff to watercourses has the potential to introduce contaminants from roads and vehicles into receiving watercourses. Opportunities to mitigate such effects, through soft treatment interventions such as SuDS, ponding, and reed bed treatments prior to discharge in receiving watercourses should be considered in alleviating the significance of such effects.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix E for further details.

Table 10-20 – Number of London Catchments and LRZs identified with LSE against each Objective B2.3

GSO Description: B2.3 Disconnect existing surface water systems from combined sewers and discharge to watercourse

Progressively disconnect surface water sewers from existing combined sewer networks and direct discharge to suitable receptors (gravity, vacuum or pressurised).

No. of Catchments where GSO is promoted	No. of Catchments with LSE (Beneficial)	No. of Catchments with LSE (Adverse)	Percentage of all Catchments where GSO proposed result in LSE
2	2	2	100%

Significance of Effect	SEA Objective										
	Objective 1: To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Objective 2: To strengthen the connections between people and nature and realise the value of biodiversity	Objective 3: To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Objective 4: To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Objective 5: To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Objective 6: To reduce and manage flood risk	Objective 7: To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Objective 8: To reduce air pollutant and greenhouse gas emissions	Objective 9: To adapt and improve resilience to the threats of climate change	Objective 10: To conserve and enhance the historic environment, the heritage assets therein and their setting	Objective 11: To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside
+++	2	0	0	2	0	0	0	0	0	0	0
++	0	2	2	0	2	2	0	0	2	0	0
---	0	0	0	0	0	0	0	0	0	0	0
-	2	0	2	2	2	2	0	2	0	0	0

10.2.6. B2.4 Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s)

Table 10-21 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.6.1. Significant Beneficial effects

Significant beneficial effects have been identified for both Mogden STW (catchment) and Mogden STW North (London Risk Zone) where GSO B2.4 has been proposed.

Major Beneficial effects have been identified against both areas for Objectives 1 (Biodiversity), 4 (Material Assets), 6 (Flood Risk) and 9 (Climate).

Moderate beneficial effects are also identified against both areas in respect of Objectives 2 (Biodiversity), 3 (Population and human health), and 5 (water quality). Additionally, moderate beneficial effects are identified against Mogden STW for Objective 10 (Heritage).

The assessment has shown (refer to the B2.4 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits anticipated stem from increased capacity, increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding). In catchments that are highly sensitive in respect of population, biodiversity, water, climate, material assets and heritage, reductions in flooding (including out of sewer flooding) have the potential to return the greatest benefits. These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

Of note in Mogden STW there are 2,260 areas utilised for recreation or which benefit the community, 434 areas where vulnerable population groups would be expected and 195 Noise Important Areas. Also identified within the catchment are three internationally designated site, 15 nationally designated sites and 30 locally designated sites. High sensitivity is also reflected in the water environment through designation of two DWSZ, there are also eight areas of SPZ, and 103 rivers/ waterbodies/tributaries within the catchment. 12 Communities at Risk Areas, 115 Flood Warning Areas and 74 Flood Alert Areas have also been identified within the catchment. In respect of Material Assets, a high percentage of the area is urbanised. Mogden STW is also intersected by a World Heritage Site. In Mogden STW North there are 365 areas utilised for recreation or which benefit the community, 70 areas where vulnerable population groups would be expected and 15 Noise Important Areas. Also identified within the London Risk Zone are seven nationally designated sites and 10 locally designated sites. High sensitivity is also reflected in the water environment through designation of three DWSZ, there are also six areas of SPZ, and 50 rivers/ waterbodies/tributaries within the London Risk Zone. 110 Communities at Risk Areas, 12 Flood Warning Areas and 14 Flood Alert Areas have also been identified.

10.2.6.2. Significant Adverse effects

Both of the areas where GSO B2.4 is proposed are anticipated to result in significant adverse effects. Major adverse effects have been identified in both areas owing to increased sensitivity measured against Objective 7 (soils).

Moderate adverse effects have been identified for both areas in respect of Objectives 1 (Biodiversity), 3 (Population and human health), 4 (Material assets), 5 (Water quality), 6 (Flood risk) and 8 (Air). Additionally, moderate adverse effects are identified against Mogden STW for Objective 10 (Heritage).

The assessment has shown (refer to the B2.4 Magnitude of Impact proforma located in Volume 2 Appendix C) that the adverse effects are for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to install deep tunnels. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity it is anticipated that construction of deep tanks and tunnels may result in short to medium-term loss or damage owing to the requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the area impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potential for permanent loss or damage has however been identified in respect of a number of Objectives. These are in respect of topics of Material assets, (Objective 4), Water quality (Objective 5), Soil (Objective 7)

and Heritage (Objective 10). While the magnitude of loss/damage depends on the size of deep tunnels installed, alongside considerations including precise location, such interventions have the potential to result in the permanent loss or disturbance to material assets (including underground services and infrastructure), soils (of note over 90% of Mogden STW catchment is classified as either Grades 1, 2 or 3 Agricultural land), as well as to heritage assets such as Listed Buildings, Scheduled Monuments and to the Royal Botanic Gardens World Heritage Site.

10.2.6.3. Mitigation

Mitigations in respect of GSO B2.4 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, deep tunnels present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified largely associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Permanent loss or damage to soils is a considerable risk associated with this option identified in both of the areas. Loss or damage to material assets and heritage assets are also key considerations owing to the potential permanence of the impact. Such impacts can however be mitigated through careful site selection (avoiding areas of increased heritage value and best and most versatile soils), pre-construction surveys such as soil classification surveys and archaeological trenching and supervision of works.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent), particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix E for further details.

Table 10-21 – Number of London Catchments and LRZs identified with LSE against each Objective B2.4

GSO Description: B2.4 Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s)

10.2.7. B2.5 Combined sewer separation. Convert existing combined sewers to fowl only and convey surface water on the surface using SuDS measures

Table 10-22 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.7.1. Significant Beneficial effects

Deephams STW is the only catchment where GSO B2.5 has been proposed. Major Beneficial effects have been identified against Objectives 1, 5, 6 and 9 (Biodiversity, Water and Climate topics) for the catchment. Moderate beneficial effects are identified against Objectives 2 - 4 and 10 (covering topics of Biodiversity, Population and Human health, Material Assets and Heritage).

The assessment has shown (refer to the B2.5 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with converting existing combined sewers to fowl only and conveying surface water on the surface using SuDS measures, surround a potential reduction in flooding (including out of sewer flooding) and overflows and improved capacity, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment, heritage and climate change. Of note in Deephams STW there are three internationally designated sites, six nationally designated sites and nine locally designated sites. Also identified within the catchment are 1,131 areas utilised for recreation or which benefit the community, 236 areas where vulnerable population groups would be expected and 97 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of five DWSZ, there are also 16 areas of SPZ, and 95 rivers/waterbodies/tributaries within the catchment. Deephams STW has 852 listed buildings, 13 scheduled monuments, 10 registered parks and gardens and one registered battlefield within it. Ten Communities at Risk Areas, 42 Flood Warning Areas and 60 Flood Alert Areas have also been identified within the catchment.

10.2.7.2. Significant Adverse effects

While no Major Adverse effects have been identified, Moderate adverse effects for the catchment are anticipated against Objectives 1 – 6 and 8 -10 (covering topics of Biodiversity, Population and Human health, Material Assets, Water, Air and Climate and Heritage).

The assessment has however shown (refer to the B2.5 Magnitude of Impact proforma located in Volume 2 Appendix C) that the adverse effects identified are, for the most part, temporary to the construction phase and are therefore reversible. Construction works are likely to be required to convert existing sewers. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to air quality it is anticipated that converting existing sewers may result in short to medium-term loss or damage owing to activities associated with their construction, including the use of heavy plant and machinery. In Deephams STW the receptors causing high sensitivity in regard to Biodiversity, Population and Human health, Water, Material Assets, Heritage and Climate are outlined above. High sensitivity is reflected in air quality in Deephams STW with the designation of 12 AQMAs, 47 nature conservation sites and 216 sensitive receptors within the catchment.

Potentially permanent loss or damage has been identified in respect of material assets in particular (Objective 4). While the magnitude of loss/damage depends on the extent of works, alongside considerations including precise location, there is potential to result in the permanent loss or disturbance to material assets where new channels and SuDS features are required to convey surface water. While this also has the potential to impact on biodiversity through habitat loss, it is anticipated that effects will be reduced as new habitats become established (along new surface water channel reaches or at new SuDs locations).

10.2.7.3. Mitigation

Mitigations in respect of GSO B2.5 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, converting existing sewers and conveying surface water on the surface using SuDS measures presents significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local

communities/vulnerable human receptors present within catchment, water and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Loss or damage to biodiversity assets and material assets are key considerations owing to the permanence of the impact. Such impacts may be mitigated through careful site selection (avoiding areas of increased biodiversity value), pre-construction surveys and consideration of the timing of construction works in relation to ecological windows.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent. See Volume 2 Appendix E for further details.

10.2.8. B2.6 Recreate historical rivers to convey surface water

Table 10-23 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.8.1. Significant Beneficial effects

Beckton STW is the only catchment where GSO B2.6 has been proposed. Major Beneficial effects have been identified against Objectives 2 - 6 (Biodiversity, Population and Human health, Material Assets and Water) for the catchment. Moderate beneficial effects are identified for the catchment against Objectives 1, 8, 9 and 10 (covering topics of Biodiversity, Air and Climate and Heritage).

The assessment has shown (refer to the B2.6 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with recreating historical rivers to convey surface water surround a potential reduction in flooding (including out of sewer flooding) and improved capacity, as well as a potential habitat for wildlife and a recreational asset, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment, air and climate change, heritage and landscape. Of note in Beckton STW catchment there are three internationally designated sites, six nationally designated sites and 24 locally designated sites. Also identified within the catchment are 3,208 areas utilised for recreation or which benefit the community, 725 areas where vulnerable population groups would be expected and 331 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of one DWSZ, there are also 27 areas of SPZ, and 64 rivers/waterbodies/tributaries within the catchment. 15 Communities at Risk Areas, 38 Flood Warning Areas and 62 Flood Alert Areas have also been identified within the catchment. Beckton STW catchment is also intersected by 3 World Heritage Sites, along with a number of listed buildings, scheduled monuments and registered battlefields.

10.2.8.2. Significant Adverse effects

While no Major Adverse effects have been identified, Moderate adverse effects for the catchment are anticipated against Objectives 1 – 6, 8 and 10 (covering topics of Biodiversity, Population and Human health, Material Assets, Water, Air and Heritage).

The assessment has shown (refer to the B2.6 Magnitude of Impact proforma located in Volume 2 Appendix C) that these adverse effects identified are, for the most part, temporary to the construction phase and are therefore reversible. Construction works are likely to be required to recreate historical rivers. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to air quality it is anticipated that recreating historical rivers to convey surface water may result in short to medium-term loss or damage owing to activities associated with construction, including the use of heavy plant and machinery. In Beckton STW catchment the receptors causing high sensitivity in regard to Biodiversity, Population and Human health and Material Assets, Water and Heritage are outlined above. High sensitivity is reflected in air quality in Beckton STW catchment with the designation of 17 AQMAs, 37 nature conservation sites and 681 sensitive receptors within the catchment.

While the magnitude of loss/damage depends on the extent of works, alongside considerations including precise location, the recreation of historical rivers has the potential to result in the permanent loss or disturbance to biodiversity (habitat loss or damage), soils (land use change) and heritage assets (loss or damage to heritage features along existing river stretch).

10.2.8.3. Mitigation

Mitigations in respect of GSO B2.6 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through providing new habitat and a recreational asset for the local population. As evident from assessment, recreating historical rivers to convey surface water presents significant opportunity to realise long term benefit across a range of topics. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within catchment, water and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Loss or damage to biodiversity assets are key considerations owing to the permanence of the impact. Such impacts may be mitigated through consideration of the timing of construction works in relation to ecological windows. It is however anticipated that post construction, new habitats would become established and conditions improve over time.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent. See Volume 2 Appendix E for further details.

Table 10-23 – Number of London Catchments and LRZs identified with LSE against each Objective B2.6

GSO Description: B2.6 Recreate historical rivers to convey surface water

As per description – this option would require activities to open up the lost watercourse and the conveyance infrastructure to get the surface water to the water course.

Significance of Effect	SEA Objective										
	Objective 1: To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Objective 2: To strengthen the connections between people and nature and realise the value of biodiversity	Objective 3: To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Objective 4: To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Objective 5: To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Objective 6: To reduce and manage flood risk	Objective 7: To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Objective 8: To reduce air pollutant and greenhouse gas emissions	Objective 9: To adapt and improve resilience to the threats of climate change	Objective 10: To conserve and enhance the historic environment, the heritage assets therein and their setting	Objective 11: To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside
+++	0	1	1	1	1	1	0	0	0	0	0
++	1	0	0	0	0	0	0	1	1	1	0
+	0	0	0	0	0	0	0	0	0	0	0
-	1	1	1	1	1	1	0	1	0	1	0

10.2.9. B2.7 Use parks and urban spaces to store excess surface water during rainfall events (Daylight surface water systems through parks to create a water-based public amenity)

Table 10-24 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.9.1. Significant Beneficial effects

Significant beneficial effects have been identified against each of the five areas (Mogden STW and Mogden Risk Zones (Central, Weald, NE and West) where GSO B2.7 has been proposed. Major Beneficial effects have been identified against Objective 3 (Population and Human health) and Objective 9 (Climate) for all five areas. Four areas are anticipated to have Major Beneficial effects for Objective 1 (Biodiversity) and three areas against Objectives 5 and 6 (Water). The remaining areas are anticipated to have moderate beneficial effects for Objectives 1, 5 and 6. Moderate beneficial effects are identified for all five areas against Objective 4 (Material Assets). Additionally, moderate beneficial effects were identified for four areas against Objective 2 (Biodiversity) and three areas for Objective 7 (Soil).

The assessment has shown (refer to the B2.7 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits anticipated largely stem from the creation of dedicated flooding areas, reduced capacity pressures on wastewater networks and wastewater resources and, consequently, reduced flooding events (including out of sewer flooding). In catchments that are highly sensitive in respect of population, biodiversity and water for example, such consequences have the potential to return the greatest benefits.

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.2.9.2. Significant Adverse effects

Significant adverse effects have been identified in all areas where GSO B2.7 are proposed. While no Major Adverse effects have been identified, Moderate adverse effects for all five areas are anticipated against Objectives 3 and 4 (Population and Human health and Material Assets). For Objective 1 and 8 (Biodiversity and Air) moderate adverse effects are anticipated for four areas. In addition, Moderate adverse effects are also identified for three of the catchments against Objective 5 - 7 (Water and Soil).

The assessment has however shown (refer to the B2.7 Magnitude of Impact proforma located in Volume 2 Appendix C) that the adverse effects identified are, for the most part, temporary to the construction phase and are therefore reversible. For example, with respect to air quality it is anticipated that implementation of SuDS measures may result in short to medium-term loss or damage owing to activities associated with their construction, including the use of heavy plant and machinery.

Potentially permanent loss or damage has been identified in respect of soil (Objective 8) considerations. While the magnitude of loss/damage depends on the extent of works, alongside considerations including precise location, this intervention has the potential to result in the permanent loss or disturbance to soil through land use change.

10.2.9.3. Mitigation

Mitigations in respect of GSO B2.7 should aim to capitalise on the benefits identified, whether this be through integrating design features that maximise biodiversity gains, strengthen flood protections or engender public connections with the natural environment. As evident from assessment, using parks and urban spaces to store excess surface water during rainfall events presents significant opportunity to realise long term benefit across a range of topics. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified should focus on the construction phase of works, addressing issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors present within catchment, water and air quality impacts.

Loss or damage to soil is a key consideration owing to the permanence of the impact. Land use change, specifically the sterilisation / loss or disturbance to high grade soils, should be mitigated through careful site selection (avoiding areas of best and most versatile soils) and pre-construction surveys such as soil classification surveys.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix E for further details.

Table 10-24 – Number of London Catchments and LRZs identified with LSE against each Objective B2.7

GSO Description: B2.7 Use parks and urban spaces to store excess surface water during rainfall events (Daylight surface water systems through parks to create a water-based public amenity)

Daylight surface water systems through parks to create a water-based public amenity with a well-defined flood plain to be used for exceedance events and/or allow surface water systems running through/under urban social spaces to flood (during extreme events) into a well-defined sacrificial storage area within the urban space. Could involve daylighting some or all of the surface water flow path but keep buried if more appropriate.

--	4	0	5	5	3	3	3	4	0	0	0

10.2.10. B3.0 Property-level protection measures to prevent buildings from flooding

Table 10-25 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.10.1. Significant Beneficial effects

Significant beneficial effects have been identified across each of the nine areas where GSO B3.0 has been proposed (Beddington, Deephams, Hogsmill, Long Reach and Riverside STW catchments and Crossness (Wandsworth), Riverside (RA03 and RA04) and Mogden NE LRZs). While no Major Beneficial effects have been identified, Moderate beneficial effects for all areas are anticipated against Objective 3 and 4 (Population and Human health and Material Assets).

Moderate beneficial effects are also identified against eight areas for Objective 9 (Climate Change). Finally, Moderate beneficial effects have been identified against five areas in respect of Flood Risk (Objective 6) and against Deephams STW for Heritage (Objective 10).

These areas have been highlighted in assessment owing to their increased sensitivity to population and human health, flood risk, climate change and material assets. Property-level protection measures to prevent flooding will reduce the risk of loss and damage to property and other assets, increase resilience in flood prone areas and reduce pressures on health and wellbeing where instances of out of sewer flooding impacting on properties is reduced. These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.2.10.2. Significant Adverse effects

No significant adverse effects have been identified. Review of the magnitude of impact proforma shows that adverse effects across the SEA topics are considered negligible, including during construction. Therefore, sensitivity of the catchment becomes less of a constraint owing to the negligible construction and operational impacts anticipated. Nevertheless, construction works should aim to reduce disturbance as far as reasonably practical.

10.2.10.3. Mitigation

Mitigations in respect of GSO B3.0 should aim to capitalise on the benefits identified within the proposed catchments whether this be through integrating design features that strengthen flood protections or engender public connections with the natural environment. Maximising these benefits will be achieved through careful site selection and early consultation with local communities and residents affected by flooding. See Volume 2 Appendix E for further details on significance attributed to each catchment where GSO B3.0 is proposed.

Table 10-25 – Number of London Catchments and LRZs identified with LSE against each Objective B3.0

GSO Description: B3.0 Property-level protection measures to prevent buildings from flooding

Provide vulnerable homes with passive flood protection measures such as flood proof doors and/or provide vulnerable homes with active property flood resilience measures such as self-sealing bath/shower systems (non-return valves). Active measures could also include the installation of FLIPs devices.

Temporary raised barriers erected in response to flood predictors in order to create a flow retention storage volume to avoid damage to property.

Increase thresholds of commercial properties to protect from more severe floods (future-proof).

Develop and build partnerships with strategic asset owners and operators to provide resilient flood protection measures.

Develop and build partnerships with property developers, product suppliers and the insurance industry to provide a framework for offering high quality affordable property flood protection measures.

10.2.11. C1.0 Intelligent sewer network to control flows

Table 10-26 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.11.1. Significant Beneficial effects

GSO C1.0 has been proposed in three catchments (Beddington STW, Hogsmill STW, Mogden STW) and one London Risk Zone (Hogsmill STW RZ01). Implementation of this measure is anticipated to result in significant beneficial effects across a range of SEA Objectives. While no Major Beneficial effects have been identified, Moderate beneficial effects are anticipated against Objectives 4 and 9 (Material Assets and Climate change) for all areas. Moderate beneficial effects are also anticipated in the three areas (Beddington, Hogsmill and Mogden STW) against Objectives 1, 5 and 6 (Biodiversity and Water).

The assessment has shown (refer to the C1.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with implementation of intelligent sewer network flow control measures surround a potential reduction in flooding and overflows, with consequential benefits for biodiversity, the water environment and material assets.

10.2.11.2. Significant Adverse effects

No significant adverse effects have been identified. Review of the magnitude of impact proforma shows that adverse effects across the SEA topics are considered negligible, including during construction. Therefore, sensitivity of the catchments becomes less of a constraint owing to the negligible construction and operational impacts anticipated. Nevertheless, any construction works associated with this option should aim to reduce disturbance as far as reasonably practical.

10.2.11.3. Mitigation

No specific mitigations recommended.

Table 10-26 – Number of London Catchments and LRZs identified with LSE against each Objective C1.0

GSO Description: C1.0 Intelligent sewer network to control flows

Active System Management (ASM) at key points in the network to optimise available network capacity by balancing network flows. E.g. Automation of weir chambers on trunk sewers. Requires deployment of sewer monitors for live/predictive modelling.

Active system management at key pumping stations across the network to optimise available network capacity by balancing network flows. Requires deployment of sewer monitors for live/predictive modelling.

Ability to monitor and control flow at pipe/chamber level.

Integrate energy and cost monitoring from operational sites into active system management decision-making process.

10.2.12. C3.1 Increased network capacity by installing larger sewers

Table 10-27 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.12.1. Significant Beneficial effects

All 21 catchments and London Risk Zones where GSO C3.1 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-27.

Major Beneficial effects have been identified against 18 areas for Objective 1 (Biodiversity) and 13 areas against Objective 6 (Flood Risk).

Moderate beneficial effects are identified against 13 or more areas in respect of Objective 2 – 5 and 9 (covering topics of Biodiversity, Population and human health, Material Assets, and Climate). Moderate beneficial effects are also identified against eight areas in respect of Objective 6 (Flood Risk), seven areas against Objective 11 (Landscape) and three areas against Objective 1 (Biodiversity) and Objective 10 (Heritage).

The assessment has shown (refer to the C3.1 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits anticipated stem from increased capacity, increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding).

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.2.12.2. Significant Adverse effects

All areas where GSO C3.1 is proposed are anticipated to result in significant adverse effects. Major adverse effects have been identified against four areas (Mogden STW catchment and Mogden Central, North and West LRZs), owing to increased sensitivity measured against Objective 7 (soils), with the remaining areas anticipated to have moderate adverse effects.

Moderate adverse effects have been identified for 17 or more catchments or London Risk Zones in respect of Objectives 1 (Biodiversity), 3 (Population and human health), 4 (Material assets), 7 (Soil) and 8 (Air). 13 areas have been identified as having Moderate adverse effects against Objectives 5 and 6 (Water) and seven areas have been identified as having Moderate adverse effects against Objective 11 (Landscape). Moderate adverse effects have also been identified against three areas (Crossness STW, Mogden STW and Crossness STW Lewisham LRZ) for Objective 10 (Heritage).

The assessment has shown (refer to the C3.1 Magnitude of Impact proforma located in Volume 2 Appendix C) that these adverse effects are, for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to install larger sewers. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity it is anticipated that installation of larger sewers may result in short to medium-term loss or damage owing to the requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the area impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potentially permanent loss or damage has been identified in respect of soil (Objective 7) and heritage (Objective 10) considerations. While the magnitude of loss/damage depends on considerations such as precise location, this intervention has the potential to result in the permanent loss or disturbance to soils, their quality and function, as well as to heritage assets such as Listed Buildings, Scheduled Monuments for those areas deemed to be of increased sensitivity.

10.2.12.3. Mitigation

Mitigations in respect of GSO C3.1 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced sewer overflows in recreational waters. As evident from assessment, larger sewers present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in catchments that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified largely associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors, landscape and air quality impacts.

Permanent loss or damage to soils is a considerable risk associated with this option identified in four of the areas as a Major adverse significance. Loss or damage to heritage assets is also a key consideration owing to the permanence of the impact. Such impacts can be mitigated through careful site selection (avoiding areas of increased heritage value and best and most versatile soils), pre-construction surveys such as soil classification surveys and archaeological trenching and supervision of works.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent), particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix E for further details.

10.2.13. C4.0 Deep tank(s) and tunnel(s) to store combined sewage

Table 10-28 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.13.1. Significant Beneficial effects

Significant beneficial effects have been identified across each of the eight areas where GSO C4.0 has been proposed, as shown in Table 10-28.

Major Beneficial effects have been identified against seven of the eight areas for Objective 1 (Biodiversity) and Objective 5 (Water). These are Beddington and Hogsmill STW catchments and the following LRZs: Beddington STW RZ Centre, Hogsmill STW RZ03, 04 and Long Reach STW RZ East and West. The remaining LRZ (Hogsmill RZ01) is assessed as having moderate beneficial effects for these objectives.

Moderate beneficial effects are identified against all catchments and London Risk Zones in respect of Objective 3 (Population and Human Health) and Objective 9 (Climate). Five or more areas might be expected to see Moderate beneficial effects in respect of issues of material assets (Objective 4), flood risk (Objective 6) and landscape/townscape (Objective 11).

The assessment has shown (refer to the C4.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that benefits anticipated stem from increased storage capacity, increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding). In those areas highly sensitive to population, biodiversity, water, climate, material assets and heritage, reductions in flooding (including out of sewer flooding), there is potential to return the greatest benefits.

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.2.13.2. Significant Adverse effects

All of the areas where GSO C4.0 is proposed are anticipated to result in significant adverse effects. While no Major Adverse effects have been identified, Moderate adverse effects have been identified for all eight catchments and London Risk Zones against Objectives 3 (Population and Human Health) and 7 (Soil).

Moderate adverse effects have been identified for seven areas in respect of Objectives 1, 5, 6 and 8 (covering topics of Biodiversity, Water and Air). In respect of Objective 4 (Material assets) six areas have been attributed with Moderate adverse effects and five areas have been identified as having with Moderate adverse effects for Objective 11 (Landscape/townscape).

The assessment has shown (refer to the C4.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that these adverse effects are, for the most part, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to install deep tanks and tunnels. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity it is anticipated that construction of deep tanks and tunnels may result in short to medium-term loss or damage owing to the requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the area impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potentially permanent loss or damage has been identified in respect of soil (Objective 7) considerations. While the magnitude of loss/damage depends on the size of tanks and tunnels installed, alongside considerations including precise location, this intervention has the potential to result in the permanent loss or disturbance to soils quality and function.

10.2.13.3. Mitigation

Mitigations in respect of GSO C4.0 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, deep tanks and tunnels present significant opportunity to realise long term benefit across a range of topics. Careful planning should ensure these benefits are exploited in areas that can expect to gain most benefit. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified largely associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors, water and air quality impacts.

Permanent loss or damage to soils is a considerable risk associated with this option identified in each of the eight catchments at a moderate adverse significance. This impact can be mitigated through careful site selection (avoiding areas of best and most versatile soils) and pre-construction surveys such as soil classification surveys.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent), particularly in those catchments and London Risk Zones which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix E for further details.

10.2.14. C5.0 Sewer lining to target infiltration hotspots

Table 10-29 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.14.1. Significant Beneficial effects

Each of the ten catchments and London Risk Zones where GSO C5.0 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-29. Major Beneficial effects have been identified against seven of the areas for Objective 4 (Material Assets), with the remaining three London Risk Zones being attributed Moderate Beneficial effects for this objective.

Moderate beneficial effects are also identified against four areas in respect of Objective 6 (Flood Risk) and eight areas for Objective 9 (Climate Change).

The assessment has shown (refer to the C5.0 Magnitude of Impact proforma) that the benefits associated with implementation of sewer lining to target infiltration hotspots surround a potential reduction in flooding (including out of sewer flooding) and increased network efficiency, with consequential benefits for material assets, flood risk and climate change.

10.2.14.2. Significant Adverse effects

No significant adverse effects have been identified. Review of the magnitude of impact proforma shows that adverse effects across the SEA topics are considered negligible. Therefore, sensitivity of the catchment and London Risk Zone becomes less of a constraint owing to the negligible construction and operational impacts anticipated.

10.2.14.3. Mitigation

No specific mitigations recommended.

10.2.15. C6.0 Transfer flows between catchments via existing connections

Table 10-30 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.15.1. Significant Beneficial effects

GSO C6.0 has been proposed in Deephams STW and Long Reach STW. Implementation of this measure will likely result in significant beneficial effects across a range of SEA Objectives. While no Major Beneficial effects have been identified, Moderate beneficial effects are anticipated against Objectives 1-6 and 9 (covering topics of Biodiversity, Population and human health, Material Assets, Water and Climate Change) for both catchments.

From review of the C6.0 Magnitude of Impact proforma, benefits associated with the implementation of transfer flows between catchments via existing connections surround a potential reduction in flooding (including out of sewer flooding), overflows and reduced capacity pressures, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change. Of note in Deephams STW there are three internationally designated sites, six nationally designated sites and nine locally designated sites. Also identified within the catchment are 1,131 areas utilised for recreation or which benefit the community, 236 areas where vulnerable population groups would be expected and 97 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through the designation of five DWSZ, there are also 16 areas of SPZ, and 95 rivers/waterbodies/tributaries within the catchment. Ten Communities at Risk Areas, 42 Flood Warning Areas and 60 Flood Alert Areas have also been identified within the catchment.

In Long Reach STW there are 14 nationally designated sites and 12 locally designated sites. Also identified within the catchment are 1,341 areas utilised for recreation or which benefit the community, 259 areas where vulnerable population groups would be expected and 125 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through the designation of 11 DWSZ, there are also 26 areas of SPZ, and 102 rivers/waterbodies/tributaries within the catchment. 150 Communities at Risk Areas, 31 Flood Warning Areas and 18 Flood Alert Areas have also been identified within Long Reach STW.

10.2.15.2. Significant Adverse effects

No significant adverse effects have been identified. Review of the magnitude of impact proforma shows that adverse effects across the SEA topics are considered negligible. Therefore, sensitivity of the catchment becomes less of a constraint owing to the negligible construction and operational impacts anticipated.

10.2.15.3. Mitigation

No specific mitigations recommended.

10.2.16. C7.0 Transfer flows between catchments via new connections

Table 10-31 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.16.1. Significant Beneficial effects

GSO C7.0 has been proposed in Beddington STW only. Implementation of this measure here will likely result in significant beneficial effects across a range of SEA Objectives. Major Beneficial effects have been identified for Objectives 1 and 4-6 (covering topics of Biodiversity, Material Assets and Water). Moderate beneficial effects are also anticipated against Objectives 2, 3, 9 and 11 (covering topics of Biodiversity, Population and human health, Climate Change and Landscape).

The assessment has shown (refer to the C7.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with implementation of transfer flows between catchments via new connections surround a potential reduction in flooding (including out of sewer flooding), overflows and reduced capacity pressures, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment, climate change and landscape. Of note in Beddington STW there are five nationally designated sites and 10 locally designated sites. Also identified within the catchment are 559 areas utilised for recreation or which benefit the community, 125 areas where vulnerable population groups would be expected and 78 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of 11 DWSZ, there are also 10 areas of SPZ, and 6 rivers/waterbodies/tributaries within the catchment. Four Communities at Risk Areas, 2 Flood Warning Areas and 5 Flood Alert Areas have also been identified within the catchment. Additionally, Beddington STW is intersected by Surrey Hills AONB.

10.2.16.2. Significant Adverse effects

Moderate adverse effects have been identified in respect of Objectives 1, 3 – 8 and 11 (covering topics of Biodiversity, Population and human health, Material Assets, Water, Soil, Air and Landscape).

From review of the C7.0 Magnitude of Impact proforma it is evident that these adverse effects are, for the most part, temporary to the construction phase and are therefore likely reversible. Heavy engineering and construction works are likely to be required to install new connections. However, restoration and enhancement of features impacted during the construction phase should be possible. For example, with respect to biodiversity it is anticipated that construction of new connections may result in short to medium-term loss or damage owing to requirement to clear land and habitat and through use of heavy plant and machinery. With the exception of access shafts and other above ground supporting infrastructure, it should be possible to restore much of the areas impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works. In Beddington STW the receptors causing high sensitivity in regard to Biodiversity, Population and Human health, Water, Material Assets and Landscape are outlined above. High sensitivity is reflected in air quality in Beddington STW with the designation of six AQMAs, nine nature conservation sites and 101 sensitive receptors within the catchment.

Potentially permanent loss or damage has been identified in respect of soil (Objective 7). While the magnitude of loss/damage depends on the size of new connections installed, alongside considerations including precise location, such interventions have the potential to result in the permanent loss or disturbance to soils, their quality and function. Of note is the presence of Grades 2 and 3 soil within Beddington STW.

10.2.16.3. Mitigation

Mitigations in respect of GSO C7.0 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced combined sewer overflows in recreational waters. As evident from assessment, transfer flows between catchments via new connections present significant opportunity to realise long term benefit across a range of topics. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified largely associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors (e.g. noise and dust), water and air quality impacts. Opportunities to

promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Permanent loss or damage to soils is a considerable risk associated with this option identified at Moderate adverse significance. Such impacts can be mitigated through careful site selection (avoiding areas of best and most versatile soils) and pre-construction surveys such as soil classification surveys.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix E for further details.

Table 10-31 – Number of London Catchments and LRZs identified with LSE against each Objective C7.0

GSO Description: C7.0 Transfer flows between catchments via new connections

This option is about creating new connections between the STW catchments to optimise capacities and to find the best balance of flow and load i.e. removing catchment boundaries. It would allow utilisation of the short term capacity in some STWs whilst other STWs are expanded or redeveloped.

Similar to the London Water Ring Main this could be a large infrastructure project that would allow most/all catchments to discharge into a single infrastructure pipe/tunnel and then allow any or all of the STWs to extract from this ring main and treat the flows. Reliant on availability of suitable STWs - London may be the only possible location for such a strategic option

10.2.17. D5.0 Construct new/additional STWs

Table 10-32 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.2.17.1. Significant Beneficial effects

Each of the two areas, Long Reach STW (catchment) and Long Reach STW RZ East (London Risk Zone), where GSO D5.0 has been proposed are likely to result in significant beneficial effects, as shown in Table 10-32.

Major Beneficial effects have been identified against both areas for Objective 1 (Biodiversity), Objective 5 (Water) and Objective 9 (Climate) and against Long Reach STW for Objective 4 (Material Assets). For Objective 4 Long Reach STW RZ East is identified as having moderate beneficial effects.

Moderate beneficial effects are identified against both areas in respect of Objective 2, 3, 6 and 11 (covering topics of Biodiversity, Population and human health, Flood and Landscape).

The assessment has shown (refer to the D5.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits anticipated stem from increased treatment capacity, increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding). In catchments and London Risk Zones that are highly sensitive in respect of biodiversity, population, material assets, water, climate, landscape and reductions in flooding (including out of sewer flooding) have the potential to return the greatest benefits. Of note in Long Reach STW catchment there are 14 nationally designated sites and 12 locally designated sites. Also identified within the catchment are 1,341 areas utilised for recreation or which benefit the community, 259 areas where vulnerable population groups would be expected and 125 Noise Important Areas. In respect of Material Assets, a high percentage of the area is urbanised. High sensitivity is also reflected in the water environment through designation of 11 DWSZ, there are also 26 areas of SPZ, and 102 rivers/waterbodies/tributaries within the catchment. 150 Communities at Risk Areas, 31 Flood Warning Areas and 18 Flood Alert Areas have also been identified within Long Reach STW. Additionally, Long Reach STW is intersected by Kent Downs AONB.

In Long Reach STW RZ East there are 13 nationally designated sites and four locally designated sites. Also identified within the London Risk Zone are 242 areas utilised for recreation or which benefit the community, 39 areas where vulnerable population groups would be expected and 38 Noise Important Areas. High sensitivity is also reflected in the water environment through designation of 7 DWSZ, there are also 16 areas of SPZ, and 96 rivers/waterbodies/tributaries within the London Risk Zone. 138 Communities at Risk Areas, 4 Flood Warning Areas and 4 Flood Alert Areas have also been identified within Long Reach STW RZ East. Additionally, Long Reach STW RZ East is intersected by Kent Downs AONB and Surrey Hills AONB.

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.2.17.2. Significant Adverse effects

Both of the areas where GSO D5.0 is proposed are anticipated to result in significant adverse effects. Major Adverse effects have been identified for both areas for Objectives 1 (Biodiversity) and 11 (Landscape).

Moderate adverse effects have been identified for both Long Reach STW and Long Reach STW RZ East against Objectives 2, 3, 5, 6 and 8 (covering topics of Biodiversity, Population and Human Health, Water and Air).

Moderate adverse effects have also been identified for Long Reach STW catchment in respect of Objective 4 (Material assets).

The assessment has shown (refer to the D5.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the adverse effects are, in some instances, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to construct STWs however, restoration and enhancement of features impacted during the construction phase may be possible. For example, with respect to air it is anticipated that construction of STWs may result in short to medium-term loss or damage through use of heavy plant and machinery. It may be possible to restore some of the areas impacted to previous land uses and/or enhance these areas for the betterment of local communities, biodiversity and landscape/townscape, upon completion of construction works.

Potentially permanent loss or damage has been identified in respect of biodiversity (Objective 1 and 2), population and human health (Objective 3) and landscape (Objective 11) considerations. While the magnitude of loss/damage depends on the size of STW, alongside considerations including precise location, such

interventions have the potential to result in the permanent loss or disturbance to biodiversity, soils and their quality and function, amenities and landscape. In Long Reach STW and Long Reach STW RZ East the receptors causing high sensitivity in regard to Biodiversity, Population and Human health, Water, Material Assets, Landscape and Climate are outlined above. High sensitivity is reflected in air quality in Long Reach STW with the designation of 17 AQMAs, 23 nature conservation sites and 231 sensitive receptors within the catchment. In Long Reach STW RZ East there are 10 AQMAs, 35 nature conservation sites and 36 sensitive receptors.

10.2.17.3. Mitigation

Mitigations in respect of GSO D5.0 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced overflows in recreational waters. As evident from assessment, new STW present significant opportunity to realise long term benefit across a range of topics. See Volume 2 Appendix E for further details.

Mitigations to address the significant adverse effects identified associated with the construction phase of works, should focus on issues such as potential biodiversity loss, health and well-being impacts on local communities/vulnerable human receptors, water and air quality impacts. Opportunities to promote and enhance biodiversity where restoration activities are required should also be seized, through appropriate consideration in design.

Permanent loss or damage to biodiversity and landscape are considerable risks associated with this option identified in both catchments at a Major adverse significance. Such impacts can be mitigated through careful site selection (avoiding areas of increased biodiversity value or increased landscape sensitivity and appropriate compensatory habitat and landscape screening).

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent), particularly in those catchments which have been identified with increased susceptibility to such impacts. See Volume 2 Appendix E for further details.

Table 10-32 – Number of London Catchments and LRZs identified with LSE against each Objective D5.0

GSO Description: D5.0 Construct new/additional STWs

10.3. Existing STW solutions

Table 10-33 and Table 10-34 display the percentage of existing STW sites where GSOs result in either significant beneficial or significant adverse Likely Significant Effects (LSE). The tables show that the two GSOs promoted are expected to result in significant beneficial effects in all of the existing STW sites they are promoted within. Significant adverse effects are identified in 24 of the 72 existing STW sites where GSO D3.0 is proposed and in all four of the existing STW sites where GSO D4.1 has been promoted.

Table 10-33 – Number of existing STWs with LSE (Beneficial) against GSO

GSO / Solution	No. of existing STWs where GSO is promoted	No. of existing STWs with LSE (Beneficial)	Percentage of all existing STWs where solution proposed result in LSE (Beneficial)
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	72	72	100%
D4.1 Buy land and expand STW (Effluent and sludge treatment)	4	4	100%

Table 10-34 – Number of existing STWs with LSE (Adverse) against GSO

GSO / Solution	No. of existing STWs where GSO is promoted	No. of existing STWs with LSE (Adverse)	Percentage of all existing STWs where solution proposed result in LSE (Adverse)
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	72	24	33%
D4.1 Buy land and expand STW (Effluent and sludge treatment)	4	4	100%

The following section provides summaries of the findings, highlighting significant beneficial and adverse effects identified across the SEA Objectives with respect to the existing STW sites and the GSOs promoted within them. Owing to the large number of existing STW sites covered under this assessment, it is not possible to identify and discuss the characteristics of each existing STW in turn. This information is presented within respective Location proformas, attached as Volume 5. Detail on the interrelationship anticipated between individual GSOs and SEA Objectives are discussed in the Magnitude of Impact proformas attached as Volume 1 Appendix C. These should be consulted for further information.

10.3.1. D3.0 Replace/retrofit/expand existing primary/secondary treatment processes

Table 10-35 identifies the number of existing STW sites with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.3.1.1. Significant Beneficial effects

Of the 72 existing STW sites where GSO D3.0 has been proposed, all are likely to result in significant beneficial effects, as shown in Table 10-35. Major Beneficial effects have been identified across five existing STW sites (Ash Vale, Beddington, Hogsmill, Long Reach and Mogden STW) for Objective 4 (Material Assets). Moderate Beneficial effects are identified for all other existing STW sites against Objective 4 (Material Assets). Moderate beneficial effects have been identified in respect of biodiversity objectives (Objective 1 and 2) for Newbury, Tring and Silchester STW. Moderate Beneficial effects have also been identified against Objective 9 (climate change) for Beddington, Nags Head Lane and Riverside STW.

The assessment has shown (refer to D3.0 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with replacing, retrofitting or expanding existing primary or secondary treatment processes surround a potential reduction in flooding (including out of sewer flooding), overflows and improved capacity, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change.

10.3.1.2. Significant Adverse effects

Significant adverse effects have been identified at 24 of the 72 existing STWs. With respect to biodiversity (Objective 1), three existing STWs (Newbury, Silchester and Tring) are considered to have the potential for moderate adverse effects. Ash Vale, Beddington, Hogsmill, Long Reach and Mogden have each been attributed moderate adverse against Objective 4 (Material Assets). Dorchester and Maple Lodge STW are considered moderate adverse in respect of Objective 7 (Soil) and 15 existing STWs are considered Moderate adverse with respect to landscape considerations (Objective 11).

While for the most part these significant adverse effects are considered to reflect short to medium term loss or damage (limited to the construction phase), permanent loss or damage may be anticipated on soils and landscape owing to potential land take requirements.

10.3.1.3. Mitigation

Mitigations to address the significant adverse effects may be of greater importance where schemes include the requirement for land take, with consequent permanent adverse effects on soils and landscape. Landscape screening, and the avoidance where possible of land take on soils considered best and most versatile are important considerations in this case. While requirement may be reduced to the construction phase, mitigation measures may also prove beneficial where significant construction works are undertaken within existing STW boundaries.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix F for further details.

Table 10-35 – Number of Existing STW Sites identified with LSE against each Objective D3.0

GSO Description: D3.0 Replace/retrofit/expand existing primary/secondary treatment processes											
Chemically Assisted Primary Sedimentation (CAPS), Dissolved Air Flotation, Lamellas, and sand ballasted primary treatment are some of the 5+ methods of getting more intensive. Primary treatment from a smaller area of land than traditional processes. There are a range of different technologies that have been identified for increasing the intensity of secondary treatment processes at the STW either with retrofitting or new build e.g. modular stacked treatment processes.

Significance of Effect	SEA Objective										
	Objective 1: To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company' s operating area	Objective 2: To strengthen the connections between people and nature and realise the value of biodiversity	Objective 3: To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Objective 4: To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Objective 5: To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Objective 6: To reduce and manage flood risk	Objective 7: To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Objective 8: To reduce air pollutant and greenhouse gas emissions	Objective 9: To adapt and improve resilience to the threats of climate change	Objective 10: To conserve and enhance the historic environment, the heritage assets therein and their setting	Objective 11: To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside
	0	0	0	5	0	0	0	0	0	0	0
	3	3	0	67	0	0	0	0	3	0	0
	0	0	0	0	0	0	0	0	0	0	0
	3	0	0	5	0	0	2	0	0	0	15

10.3.2. D4.1 Buy land and expand STW (Effluent and sludge treatment)

Table 10-36 identifies the number of existing STWs with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.3.2.1. Significant Beneficial effects

Of the four existing STWs (Culham, Sulhamstead, Thame and Wantage) where GSO D4.1 has been proposed, all are likely to result in significant beneficial effects, as shown in Table 10-36.

While no Major Beneficial effects have been identified, moderate beneficial effects have been identified for the four existing STWs against Objectives 1, 4, 5 and 9 (covering topics of Biodiversity, Material Assets, Water and Climate respectively).

From review of the D4.1 Magnitude of Impact proforma, benefits anticipated stem from increased treatment capacity and therefore increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding). This then has consequential benefits for biodiversity (specifically aquatic biodiversity) and water quality through reduced instances of overflows and improved quality of effluent discharges. These benefits extend upstream of the STW site as capacity increases result in fewer instances of foul water being diverted to into watercourses during peak or storm events.

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.3.2.2. Significant Adverse effects

Significant adverse effects are identified against each of the four existing STWs where GSO D4.1 is proposed. While no Major Adverse effects have been identified, Moderate adverse effects have been identified for the four existing STWs against Objective 1 (Biodiversity).

The assessment has shown (from review of the D4.1 Magnitude of Impact proforma) that these adverse effects are, in some instances, temporary to the construction phase and are therefore reversible. Heavy engineering and construction works are likely to be required to expand STWs however, restoration and enhancement of features impacted during the construction phase may be possible. While the magnitude of loss/damage depends on the extent of expansion of the STW and its location relative to important or protected habitat for example, such interventions have the potential to result in the permanent loss or disturbance to habitat and species.

10.3.2.3. Mitigation

Mitigations in respect of GSO D4.1 should aim to capitalise on the benefits identified, whether this be through integrating design features that minimise loss, protect and enhance local biodiversity, increase resilience to extreme weather events (flooding) or engender public connections with the natural environment through targeting reduced overflows in recreational waters. As evident from the assessment, expansion of STW presents significant opportunity to realise long term benefits across a range of topics. See Volume 2 Appendix F for further details.

Mitigations to address the significant adverse effects identified should focus on potential biodiversity loss. Permanent loss or damage to biodiversity can be mitigated through consideration at detailed design, pre-construction surveys (including habitat surveys for example) and integration of compensatory habitat.

Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix F for further details.

Table 10-36 – Number of Existing STW Sites identified with LSE against each Objective D4.1

	Objective 1: To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Objective 2: To strengthen the connections between people and nature and realise the value of biodiversity	Objective 3: To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Objective 4: To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Objective 5: To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Objective 6: To reduce and manage flood risk	Objective 7: To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Objective 8: To reduce air pollutant and greenhouse gas emissions	Objective 9: To adapt and improve resilience to the threats of climate change	Objective 10: To conserve and enhance the historic environment, the heritage assets therein and their setting	Objective 11: To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside
	+++	0	0	0	0	0	0	0	0	0	0
	++	4	0	0	4	4	0	0	0	4	0
	+	0	0	0	0	0	0	0	0	0	0
	--	4	0	0	0	0	0	0	0	0	0

10.3.3. WC01: Grit removal and increased capacity at Maple Lodge and linked Blackbirds STWs

Table 10-37 identifies the number of catchments with significant effects (both beneficial and negative) against each of the SEA Objectives.

10.3.3.1. Significant Beneficial effects

Maple Lodge is the only catchment where this GSO is proposed. Major Beneficial effects have been identified for Objective 4 (Material Assets). Moderate Beneficial effects are identified in Maple Lodge STW catchment against Objective 1 - 3 (Biodiversity and Population and Human Health), 5 and 6 (Water and Flood Risk) and 9 (Climate Change).

The assessment has shown (refer to Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits associated with improving or expanding existing primary or secondary treatment processes surround a potential reduction in flooding (including out of sewer flooding), overflows and improved capacity, with consequential benefits for biodiversity, health and wellbeing, material assets, the water environment and climate change.

10.3.3.2. Significant Adverse effects

No Major adverse effects have been identified. Moderate adverse effects have been identified in Maple Lodge STW catchment with respect to Objectives 1 (Biodiversity), 3-6 (Population and Human Health, Material Assets, Water and Flood Risk), 8 (Air) and 11 (Landscape).

While for the most part these significant adverse effects are considered to reflect short to medium term loss or damage (limited to the construction phase), permanent loss or damage may be anticipated where there is potential land take requirements associated with capacity increases at Maple Lodge STW catchment.

10.3.3.3. Mitigation

Mitigations to address the significant adverse effects may be of greater importance if there is a requirement for land take, with consequent permanent adverse effects on biodiversity, soils and landscape for example. Landscape screening, and the avoidance where possible of land take on soils considered best and most versatile, may be important considerations in this case.

Construction should seek to minimise as far as reasonably practical disruptions (temporary and permanent). See Volume 2 Appendix D for further details.

Table 10-37 – Number of Catchments identified with LSE against each Objective Wild Card

GSO Description: Wild Card – Grit removal and increased capacity at Maple Lodge and linked Blackbirds STWs											
There are a range of different technologies that have been identified for increasing capacity of treatment processes at the STW either with retrofitting or new build e.g. modular stacked treatment processes.

Significance of Effect	SEA Objective										
	Objective 1: To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Objective 2: To strengthen the connections between people and nature and realise the value of biodiversity	Objective 3: To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Objective 4: To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Objective 5: To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Objective 6: To reduce and manage flood risk	Objective 7: To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Objective 8: To reduce air pollutant and greenhouse gas emissions	Objective 9: To adapt and improve resilience to the threats of climate change	Objective 10: To conserve and enhance the historic environment, the heritage assets therein and their setting	Objective 11: To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside
	+++	0	0	0	1	0	0	0	0	0	0
	++	1	1	1	0	1	1	0	0	1	0
	+	0	0	0	0	0	0	0	0	0	0
	--	1	0	1	1	1	1	0	1	0	1

10.3.4. WC02: Major upgrade to inlet pumping station at Hogsmill STW

Table 10-38 identifies significant effects (both beneficial and negative) against each of the SEA Objectives.

10.3.4.1. Significant Beneficial effects

A major upgrade to the inlet pumping station at Hogsmill STW catchment is likely to result in significant beneficial effects across eight of the eleven SEA Objectives, as shown in Table 10-38.

Moderate beneficial effects are identified in respect of Objective 1 – 6, 9 and 11 (covering topics of Biodiversity, Population and human health, Material Assets, Water, Climate and Landscape).

The assessment has shown (refer to the WC02 Magnitude of Impact proforma located in Volume 2 Appendix C) that the benefits anticipated stem from an inferred increased capacity which may be associated with upgrading of the pumping station. As a result, increased resilience to extreme weather events (specifically flood events) and reduced instances of overflows and flooding (including out of sewer flooding) may be anticipated. This is further strengthened where upgrades to assets reduce discharges associated with equipment related failure.

These effects are anticipated during the operational phase and are therefore long term, permanent in duration.

10.3.4.2. Significant Adverse effects

Major adverse effects have not been identified with respect to this Wild Card option.

Moderate adverse effects have however been identified in respect of Biodiversity, Population and Human health, Material Assets, Water, Air and Landscape Objectives.

The assessment has shown (refer to the WC02 Magnitude of Impact proforma located in Volume 2 Appendix C) that these adverse effects are in each case likely, temporary to the construction phase and therefore reversible. While construction works are likely to be required to upgrade the pumping station, these are likely to be confined to the existing footprint of the site. Effects during the operational phase are unlikely to be compounded or significantly different to those at present.

10.3.4.3. Mitigation

Mitigations should focus on issues such as potential biodiversity loss required through vegetation clearance, health and well-being impacts on local communities/vulnerable human receptors, landscape and air quality impacts associated with construction. This may be achieved through implementation of a Construction Environmental Management Plan. Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix E for further details.

Table 10-38 – Number of London Catchments and LRZs identified with LSE against each Objective Wild Card

WC Description: Major upgrade to inlet pumping station at Hogsmill STW											
On existing STW site, improvement/new pumping station to pass more flows forward to treatment from the catchment											
No. of Catchments where WC is promoted		No. of Catchments with LSE (Beneficial)			No. of Catchments with LSE (Adverse)			Percentage of all Catchments where WC proposed result in LSE			
1		1			1			100%			
Significance of Effect	SEA Objective										
	Objective 1: To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company' s operating area	Objective 2: To strengthen the connections between people and nature and realise the value of biodiversity	Objective 3: To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Objective 4: To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Objective 5: To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Objective 6: To reduce and manage flood risk	Objective 7: To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Objective 8: To reduce air pollutant and greenhouse gas emissions	Objective 9: To adapt and improve resilience to the threats of climate change	Objective 10: To conserve and enhance the historic environment, the heritage assets therein and their setting	Objective 11: To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes, and the countryside
	+++	0	0	0	0	0	0	0	0	0	0
	++	1	1	1	1	1	1	0	0	1	0
	+	0	0	0	0	0	0	0	0	0	0
	-	1	0	1	1	1	1	0	1	0	0

10.3.5. WC03: Iver South STW mixed liquors alternative discharge location (discharge to sewer for treatment at STW)

Table 10-39 identifies significant effects (both beneficial and negative) against each of the SEA Objectives.

10.3.5.1. Significant Beneficial effects

Significant beneficial effects have been identified in respect of the Wild Card option to facilitate an alternative discharge location for mixed liquors at Iver South STW as shown in Table 10-39. While no Major Beneficial effects have been identified, moderate beneficial effects are identified in respect of SEA Objective 1 (Biodiversity), 3 (Population and Human health) and 5 (Water).

The assessment has shown (refer to the B2.1 Magnitude of Impact proforma in Volume 2 Appendix C) that the benefits are anticipated owing to improved quality of effluent discharges with consequential benefits for receiving watercourses, marine habitat/species, and health and wellbeing.

10.3.5.2. Significant Adverse effects

Significant adverse effects are anticipated in respect of SEA Objective 1 (Biodiversity) and 5 (Water). While no Major Adverse effects have been identified, Moderate adverse effects for both these Objectives and review of the Magnitude of Impact proforma and catchment proforma attributes this to construction related impacts that may be realised in order to connect/divert effluent. Such effects are therefore temporary to the construction phase and reversible.

While the magnitude of loss/damage depends on the extent of works, alongside considerations including precise location and receiving watercourses which are likely to be in close proximity, this intervention has the potential to result in disturbance to biodiversity including aquatic biodiversity and to water quality during construction.

10.3.5.3. Mitigation

Mitigations should focus on ensuring that any construction works required to facilitate the alternative discharge do not adversely impact on local biodiversity or water quality. This may be achieved through implementation of Construction Environmental Management Plans that include measures to protect water quality and biodiversity. Construction should seek to minimise as far as reasonably practical such disruptions (temporary and permanent). See Volume 2 Appendix E for further details.

Table 10-39 – Number of London Catchments and LRZs identified with LSE against each Objective Wild Card

WC Description: Iver South STW mixed liquors alternative discharge location			
Although there would be limited construction, works may be anticipated to connect/divert discharges to existing sewers.

10.3.6. WRMP Teddington Reuse scheme

Mitigations should focus on ensuring that any construction works required to facilitate the alternative discharge do not adversely impact on local biodiversity or water quality. This may be achieved through implementation of Construction Environmental Management Plans that include measures to protect water quality and biodiversity.

WRMP24 is proposing a scheme to increase [river abstraction at Teddington](#). This would be facilitated by wastewater currently discharging from Mogden STW being highly treated and discharged further upstream on the River Thames to compensate for the additional water taken. While this scheme would have an impact on our wastewater services the primary need for the scheme is from a WRMP perspective. This potential solution has therefore been subject to an environmental assessment as part of WRMP process (see draft [WRMP 2024 Technical Appendix B – Strategic Environmental Assessment](#) which identified no major or moderate negative effects).

10.4. Significance of Effect Assessment Summary

Owing to the significant number of locations (catchments, existing sewage treatment works and to a lesser extent risk zones) included in this first iteration of the DWMP, this assessment is summative in nature. This assessment has reported on the number of catchments against which specific GSO types are proposed, summarising significant effects identified (beneficial and adverse) and, where significant adverse effects have been identified, listed appropriate mitigations which should be considered to reduce those effects. The assessment relies on the interaction of the sensitivity of each location and the magnitude of impact for each GSO type. While it is only possible to provide a high level review of this interaction in this report, each derived effect for each proposed GSO in each proposed location has been included in appendices attached to this report (See Volume 2 Appendices D - F). In review of the assessment information reported through Section 10, a summary for each of the three area types is made, as follows:

10.4.1. All Catchments (excluding London Catchments and LRZs)

A total of nine GSO types have been promoted within these catchments either individually or in combination with another. With the exception of property level flood protection measures (B3.0), each of the promoted GSOs are anticipated to result in significant beneficial effects to the environment in at least 80% of the catchments they are promoted in. Seven GSO types are anticipated to result in significant beneficial effects in all of the catchments they are promoted within. Property level flood protection measures are anticipated to result in significant beneficial effects for just over 20% (4/19) of the catchments they are promoted within.

Of the nine GSOs promoted, four are anticipated to result in significant adverse effects (Source control SuDS measures (B1.1), deep tanks and tunnels (C4.0), transfer flows between catchments via new connections (C7.0) and replace/retrofit/expand existing primary/secondary treatment processes (D3.0)). The assessment however has shown that these effects are temporary and limited to the construction phase, as recorded in respective GSO impact magnitude tables.

10.4.2. London Catchments and LRZs

A total of 18 GSO types have been promoted within the eight London Catchments and 36 London Risk Zones either individually or in combination with another. Each of the 18 promoted GSO types are anticipated to result in significant beneficial effects in all of the areas they are promoted in.

In total, 14 of the GSO types are anticipated to result in significant adverse effects. However, as with all catchments assessed, the assessment has shown that these effects are largely temporary and limited to the construction phase. The promotion of new/additional STWs (D5.0) in the Long Reach catchment and risk zone proves the exception. As the magnitude of impact proforma highlights, this GSO may lead to permanent loss or damage to biodiversity, soils and landscape for example. Nevertheless, by reporting on these and other issues at this stage, this assessment can act to inform the design, construction and operation of each GSO type within respective catchments, including the site selection process which should reflect and build upon the constraints identified in the respective catchment proformas.

10.4.3. Existing STWs

Within existing STWs, two GSO types are promoted, either individually or in combination with each other. These are to Replace/retrofit/expand existing primary/secondary treatment processes (D3.0) and to buy land and expand STW (D4.1). Both of these GSO types are anticipated to directly result in significant beneficial effects in all of the sites they are promoted within. While significant beneficial effects are already identified in this high-level assessment of the STW sites, it is likely that many more indirect benefits would be realised throughout the wider network, not captured in assessment of the STW sites. Improved capacity of treatment plants and improved quality of effluent discharges would lead to a range of environmental improvements throughout the wider respective STW catchments, this includes throughout the drainage and wastewater network, at and beyond the discharge location (via hydrological connections). Both D3.0 and D4.1 have been identified with the potential to give rise to significant negative effects at 24 of 72 and 4 of 4 existing STW sites respectively. For the most part, these significant adverse effects are considered to reflect short to medium term

loss or damage which is limited to the construction phase, requirement for additional land take does give rise to the potential for permanent impacts, particularly on biodiversity, soils and landscape.

10.4.4. Summary of Assessment

The assessment of GSO's in each area type briefed therefore finds that **significant beneficial effects will likely result across a majority of the catchments, risk zones and existing STW sites**. The assessment shows that the significant beneficial effects identified are long term and operational in nature, stemming from aims to reduce frequency and severity of spills (including combined sewer overflow events), reduce and improve resilience to flooding, improve quality of effluent discharges and improve efficiency of wastewater networks and processes. The assessment provides strong evidence that the options briefed in respect of these catchments, risk zones and existing STW sites will improve environmental quality both directly and indirectly across seven SEA topics (Table 8-3). This is attributed to the range of operational beneficial impacts identified against respective GSOs and increased sensitivities of many of these locations to biodiversity, water quality, flood risk, material assets, climate change and human health.

Significant adverse effects generally centre around a much smaller list of SEA Objectives, specifically biodiversity, soils and landscape as a result of the GSO magnitude of impact findings in respect of these topics (as summarised in Table 8-4). Increased locational sensitivity at different catchments, risk zones and existing STWs (reported in Section 9) however expands this list to include potential significant adverse effects across the full suite of SEA Objectives.

The assessment shows that many of the significant adverse effects identified are construction specific effects that are not anticipated to continue through to the operational phase. These effects are therefore considered temporary and likely reversible. Through early consideration of the adverse effects identified in this assessment, measures to mitigate the potential impacts, reducing the likelihood for significant adverse effects, can be established. These assessment findings can therefore also inform site selection and design of options within catchments to further mitigate adverse effects.

11. Final Plan

The assessments detailed in this report thus far have taken account of all GSO's briefed at the ODA stage within each catchment, LRZ and existing STW site, with the intention that derived significance of effects data across each of the proposed GSO's could be translated and integrated into metrics that inform the content and options promoted in the Final Plan. The bank of assessment data reported in Chapter 10 and associated Appendices can also be called upon to inform environmental appraisal of future iterations of the DWMP and where GSO types may change during solution development. This includes Appendices D, E and F which identify GSO's included and excluded from the Final Plan in respect of each of the three area types, alongside their associated likely significant effects. Environmental baseline proformas for each of the catchments, risk zones and existing STW sites briefed at the ODA stage (as well as at subsequent stages where applicable) and therefore including those that make it to the Final Plan, are included as Volumes 3, 4 and 5.

The first iteration of the Final Plan has been developed and identifies specific GSO's for each catchment, London risk zones and existing STW. For the most part, the GSO's presented in the Final Plan represent a subset of those assessed and reported upon in Chapter 10. The decision-making process that informed GSO selection for the Final Plan included a range of economic, engineering and environmental metrics, as well as consideration of consultation comments received in respect of the Preferred Plan. The environmental metrics included those LSEs derived through this assessment, as reported in Chapter 10 and summarised in Appendix D, E and F. This Chapter (Chapter 11) then summarises the Final Plan and the associated LSEs, which have been previously derived, as well as a small number of additional catchments and associated GSO's that have been identified subsequent to consultation on the Preferred Plan. While this Chapter focuses on those GSO's that make it to the Final Plan, it also highlights the implications (beneficial and adverse) of the GSO's that did not make it to the Final Plan. Reference should still be made to respective assessments covered in Chapter 10 for further detail at the individual GSO level.

As such, the following reflects the Final Plan, which has built upon the Preferred Plan outlined in previous iterations of this assessment report, through consideration of consultation responses and further technical work.

11.1. All Catchments (excluding London Catchments, LRZ and existing STWs)

With respect to the GSOs in the Final Plan for the 'all catchments' area type, and in comparison to those briefed in Chapter 10, the GSOs generally apply to a significantly higher number of catchments. This is with the exception of B3.0 (Property-level protection) where the option has been re-classified from C4.0 (Deep tanks and tunnels) in a number of cases to that previously briefed. Table 11-1 and Table 11-2 summarise the number of catchments in which the options are selected and the likely significant beneficial and adverse effects resulting.

In respect of the GSOs promoted in the Final Plan, Table 11-1 show that significant beneficial effects are anticipated across at least 71% of the catchments and in most cases all of the catchments.

Five of the options promoted in the Final Plan for the 'all catchments' area type (B1.1, C3.1, C4.0, D3.0 and D4.1) are expected to result in significant adverse effects, and this applies across at least 70% of the catchments where these GSOs are promoted. No significant adverse effects are anticipated against B3.0 and C5.0.

Table 11-1 –Options Selected in All Catchments (excluding London Catchments, LRZ and existing STWs) with LSE (Beneficial)

Option	Number of catchments in which it is selected	No. of Catchments with LSE (Beneficial)	Percentage of all Catchments where solution proposed result in LSE (Beneficial)
B1.1 Source control SUDS measures*	238	186	78%
B3.0 Property-level protection measures to prevent buildings from flooding	128	91	71%
C3.1 Increased network capacity by installing larger sewers	66	66	100%
C4.0 Deep tank(s) and tunnel(s) to store combined sewage	229	229	100%
C5.0 Sewer lining to target infiltration hotspots	101	101	100%
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	174	174	100%
D4.1 Buy land and expand STW (Effluent and sludge treatment)	8	8	100%

*while further technical assessment is required, it is understood B1.1 will in some locations potentially be blended with C4.0

Table 11-2 –Options Selected in All Catchments (excluding London Catchments, LRZ and existing STWs) with LSE (Adverse)

Option	Number of catchments in which it is selected	No. of Catchments with LSE (Adverse)	Percentage of all Catchments where solution proposed result in LSE (Adverse)
B1.1 Source control SUDS measures*	238	186	78%
B3.0 Property-level protection measures to prevent buildings from flooding	128	0	0%
C3.1 Increased network capacity by installing larger sewers	66	66	100%
C4.0 Deep tank(s) and tunnel(s) to store combined sewage	229	229	100%
C5.0 Sewer lining to target infiltration hotspots	101	0	0%
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	174	121	70%
D4.1 Buy land and expand STW (Effluent and sludge treatment)	8	8	100%

*while further technical assessment is required, it is understood B1.1 will in some locations potentially be blended with C4.0

The following options are no longer promoted (i.e. dropped after development of the Preferred Plan) for any of the catchments outside of the London Catchments, LRZ and existing STWs:

- B1.2 Targeted source control SuDS measures at major opportunity areas;
- C1.0 Intelligent sewer network to control flows

- C2.0 Proactive maintenance;
- C6.0 Transfer flows between catchments via existing connections; and
- C7.0 Transfer flows between catchments via new connections.

As a result, the Final Plan **is not** anticipated to realise significant adverse effects identified in relation to these GSOs. This includes:

- Significant adverse effects are no longer anticipated in eight catchments in relation to B1.2 Targeted source control SuDS measures at major opportunity areas – these significant adverse effects were predicted across a number of SEA objectives including Water and Landscape. These effects were anticipated during construction only; and
- Moderate adverse effects are no longer anticipated at Culham STW catchment owing to the dropping of C7.0 Transfer flows between catchments via new connections – moderate adverse effects were predicted in this catchment against Objectives 3 and 7.

While it is important to note that the solutions promoted in the Final Plan will realise significant beneficial effects for some of these catchments, there are also now significant beneficial effects that will **no longer** be realised in respect of specific options. These include:

- Significant beneficial effects are no longer anticipated in 23 catchments in relation to B1.2 Targeted source control SuDS measures at major opportunity areas. These effects were predicted across a number of SEA objectives with significant beneficial effects being attributed to all catchments for Water and Climate Change;
- Moderate beneficial effects are no longer anticipated in Slough STW catchment in relation to C1.0 Intelligent sewer network to control flows. These moderate beneficial effects were anticipated against Objectives 1, 4-6 and 9;
- Significant beneficial effects are no longer anticipated in Maple Lodge STW catchment in relation to C2.0 Proactive maintenance and C6.0 Transfer flows between catchments via existing connections. Moderate beneficial effects were predicted in this catchment in relation to C2.0 against Objectives 1 and 3-6 and against Objectives 1-6 and 9 for option C6.0; and
- Moderate beneficial effects are no longer anticipated in Culham STW catchment in relation to C7.0 Transfer flows between catchments via new connections - moderate beneficial effects were predicted in this catchment against Objectives 1, 3-6 and 9 and included potentially permanent effects on soils.

Tables identifying all solutions proposed and all solutions no longer proposed in the Final Plan and their attributed likely significant effects (beneficial and adverse), are included as Appendix D.

11.2. London Catchment and LRZ Solutions

The options that have been promoted in the Final Plan are generally reflected in similar or slightly lower numbers of catchments or risk zones than that assessed in Chapter 10. The implications of this have been set out in Table 11-3 and Table 11-4, which identify the instances of significant beneficial and adverse effects that result.

The tables show that all 10 GSOs promoted within the Final Plan are expected to result in significant beneficial effects. This applies across all London catchments and risk zones.

Significant adverse effects have been identified, but this applies to fewer options (8 GSOs). No significant adverse effects are anticipated against B3.0 and C5.0. This is in keeping with findings previously identified in Section 10.2.10 and 10.2.14.

Table 11-3 – Options Selected in London Catchments and LRZ with LSE (Beneficial)

Option	Number of catchments in which it is selected	No. of Catchments with LSE (Beneficial)	Percentage of all Catchments where solution proposed result in LSE (Beneficial)
B1.1 Source control SUDS measures	21	21	100%
B1.2 Targeted source control SuDS measures at major opportunity areas	14	14	100%
B2.2 Combined sewer separation. Construct new surface water sewers	4	4	100%
B2.3 Disconnect existing surface water systems from combined sewers and discharge to watercourse	1	1	100%
B2.7 Use parks and urban spaces to store excess surface water during rainfall events (Daylight surface water systems through parks to create a water-based public amenity)	3	3	100%
B3.0 Property-level protection measures to prevent buildings from flooding	13	13	100%
C3.1 Increased network capacity by installing larger sewers	30	30	100%
C4.0 Deep tank(s) and tunnel(s) to store combined sewage	26	26	100%
C5.0 Sewer lining to target infiltration hotspots	8	8	100%
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	4	4	100%

Table 11-4 – Options Selected in London Catchments and LRZ with LSE (Adverse)

Option	Number of catchments in which it is selected	No. of Catchments with LSE (Adverse)	Percentage of all Catchments where solution proposed result in LSE (Adverse)
B1.1 Source control SUDS measures	21	21	100%
B1.2 Targeted source control SuDS measures at major opportunity areas	14	14	100%
B2.2 Combined sewer separation. Construct new surface water sewers	4	4	100%
B2.3 Disconnect existing surface water systems from combined sewers and discharge to watercourse	1	1	100%
B2.7 Use parks and urban spaces to store excess surface water during rainfall events (Daylight surface water systems through parks to create a water-based public amenity)	3	3	100%
B3.0 Property-level protection measures to prevent buildings from flooding	13	13	0%
C3.1 Increased network capacity by installing larger sewers	30	30	100%

Option	Number of catchments in which it is selected	No. of Catchments with LSE (Adverse)	Percentage of all Catchments where solution proposed result in LSE (Adverse)
C4.0 Deep tank(s) and tunnel(s) to store combined sewage	26	26	100%
C5.0 Sewer lining to target infiltration hotspots	8	0	0%
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	4	4	100%

The following options are no longer being considered for any of the London Catchments and LRZ:

- B2.1 Combined sewer separation (parallel foul sewer network);
- B2.4 Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s);
- B2.5 Combined sewer separation. Convert existing combined sewers to fowl only and convey surface water on the surface using SuDS measures;
- B2.6 Recreate historical rivers to convey surface water;
- C1.0 Intelligent sewer network to control flows;
- C6.0 Transfer flows between catchments via existing connections;
- C7.0 Transfer flows between catchments via new connections; and
- D5.0 Construct new/additional STWs.

In respect of these specific solutions, the following likely significant adverse effects will therefore no longer be realised:

- Significant adverse effects (for the most part temporary to the construction phase) anticipated against Objectives 1, 3 – 6 and 8 for Beckton STW and Crossness STW catchments in relation B2.1 Combined sewer separation (parallel foul sewer network);
- Significant adverse effects anticipated against Objectives 1, 3-8 for Mogden STW (catchment) and Mogden STW North (London Risk Zone) and Objective 10 for Mogden STW in relation to B2.4 Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s);
- Significant adverse effects (for the most part temporary to the construction phase) anticipated against Objectives 1 – 6 and 8 -10 for Deephams STW catchments in relation to B2.5 Combined sewer separation, convert existing combined sewers to fowl only and convey surface water on the surface using SuDS measures;
- Significant adverse effects (for the most part temporary to the construction phase) anticipated against Objectives 1 – 6, 8 and 10 for Beckton STW catchments in relation to B2.6 Recreate historical rivers to convey surface water;
- Significant adverse effects (both temporary and permanent) anticipated against Objectives 1-6, 9 and 11 for Beddington STW catchments in relation to C7.0 Transfer flows between catchments via new connections; and
- Significant adverse effects anticipated against Objectives 1 - 3, 5, 6, 8 and 11 at Long Reach STW (catchment) and Long Reach STW RZ East (London Risk Zone) and Objective 4 at Long Reach STW in relation to D5.0 Construct new/additional STWs.

While it is important to note that the solutions promoted in the Final Plan will realise significant beneficial effects for some of these London catchments and LRZs (as summarised in Table 11-4), there are significant beneficial effects associated with the unselected solutions that will **no longer** be realised. These include:

- Significant beneficial effects anticipated against Objectives 1– 6 and 9 for Beckton STW and Crossness STW catchments in relation B2.1 Combined sewer separation (parallel foul sewer network);
- Significant beneficial effects anticipated against Objectives 1 – 6 and 9 for Mogden STW (catchment) and Mogden STW North (London Risk Zone) and Objective 10 for Mogden STW in relation to B2.4 Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s);
- Significant beneficial effects anticipated against Objectives 1 – 6, 9 and 10 for Deephams STW catchments in relation to B2.5 Combined sewer separation, convert existing combined sewers to foul only and convey surface water on the surface using SuDS measures;
- Significant beneficial anticipated against Objectives 1 – 6 and 8 - 10 for Beckton STW catchments in relation to B2.6 Recreate historical rivers to convey surface water;
- Significant beneficial effects anticipated against Objectives 1, 4 - 6 and 9 for three catchments in relation to C1.0 Intelligent sewer network to control flows;
- Significant beneficial anticipated against Objectives 1 – 6 and 9 for Deephams STW and Long Reach STW catchments in relation to C6.0 Transfer flows between catchments via existing connections;
- Significant beneficial effects across the majority of SEA objectives (1-6, 9 and 11) against Beddington STW catchment in relation to C7.0 Transfer flows between catchments via new connections; and
- Significant beneficial effects anticipated against Objectives 1 – 6, 9 and 11 for Long Reach STW (catchment) and Long Reach STW RZ East (London Risk Zone) in relation to D5.0 Construct new/additional STWs.

Tables identifying all solutions proposed and all solutions no longer considered in the Final Plan and their attributed likely significant effects (beneficial and adverse) are included as Appendix E.

11.3. Existing STW

Only two solutions were briefed for existing STWs and these continue to be promoted in the Final Plan. Table 11-5 and Table 11-6 display the percentage of catchments in which the two options are selected alongside likely significant beneficial and adverse effects. Three individual Wild Card (WC) Options are also proposed at three existing STW and these are identified in Table 11-7. These were not originally briefed and as a result, assessments for these Wild Card options have been included retrospectively in Chapter 10 as Sections 10.3.3, 10.3.4 and 10.3.5, with significance of effects further summarised in Tables 11-5 and 11-6.

The tables below show that GSO D3.0 is promoted at 152 existing STW sites in the Final Plan and each of these are expected to result in significant beneficial effects. 37 of the existing STW sites are attributed with likely significant adverse effects in respect of D3.0.

All of the six existing STW sites promoted against GSO D4.1, are anticipated to result in significant beneficial and significant adverse effects. See Appendix F for further details.

Table 11-5 – Options Selected in Existing STW Sites with LSE (Beneficial)

Option	Number of sites in which it is selected	No. of Sites with LSE (Beneficial)	Percentage of all Sites where solution proposed result in LSE (Beneficial)
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	152	152	100%
D4.1 Buy land and expand STW (Effluent and sludge treatment)	6	6	100%
Wild Card Options	3	3	100%

Table 11-6 – Options Selected in Existing STW Sites with LSE (Adverse)

Option	Number of sites in which it is selected	No. of Sites with LSE (Adverse)	Percentage of all Sites where solution proposed result in LSE (Adverse)
D3.0 Replace/retrofit/expand existing primary/secondary treatment processes	152	37	24%
D4.1 Buy land and expand STW (Effluent and sludge treatment)	6	6	100%
Wild Card Options	3	3	100%

Table 11-7 – Wild Card Options

Existing STW Site	Wild Card Selected
Maple Lodge STW	WC01: Maple Lodge STW Catchment Grit removal and increased capacity at Maple Lodge and linked Blackbirds STWs
Hogsmill STW	WC02: Major upgrade to inlet pumping station at Hogsmill STW
Mogden STW	WC03: Iwer South STW mixed liquors alternative discharge location (discharge to sewer for treatment at STW)

Tables identifying all solutions proposed and all solutions no longer considered in the Final Plan and their attributed likely significant effects (beneficial and adverse) are included as Appendix F.

12. Mitigation

12.1. Introduction

The term mitigation encompasses any approach that is aimed at preventing, reducing or offsetting any significant adverse environmental effects that have been identified. In practice, a range of measures applying one or more of these approaches is likely to be considered in mitigating any significant adverse effects predicted as a result of implementing the DWMP. In addition, it is also important to consider measures aimed at enhancing positive effects. All such measures are generally referred to as mitigation measures.

However, the emphasis should be in the first instance on proactive avoidance of adverse effects. Only once alternative options (in this case GSO's) or approaches to avoiding an effect have been examined, should mitigation then examine ways of reducing the scale / importance of the effect.

Mitigation can take a wide range of forms, including:

- Refining Solutions in order to improve the likelihood of positive effects and to minimise adverse effects;
- Technical measures (such as setting guidelines) to be applied during the implementation phase;
- Identifying issues to be addressed in individual scheme design;
- Environmental Impact Assessment and the development of Environmental Management Plans for certain projects or types of project; and
- Contingency arrangements for dealing with possible adverse effects. Note this may require bespoke monitoring to be put in place.

12.2. Mitigation approaches applied through the assessment

As indicated above, avoidance of adverse impacts should be promoted in the first instance. The identification of catchment issues will allow effort to be focussed where there is an identified risk or vulnerability which requires

further investigation to determine whether future system changes result in a negative impact which may require mitigation.

Where avoidance was not possible and where GSOs have been promoted that will likely result in adverse impact, typical mitigation was considered at the design, construction and operational stages. This mitigation has been applied to each of the GSOs. This typical 'embedded' mitigation, such as 'best-practice' construction methods, has helped to inform the impact magnitude scoring rationale against each of the SEA Objectives. Typical mitigation that has been applied has been presented in Table 12-1. Volume 2 Appendix C details the specific mitigation applied to each GSOs.

It is important to recognise that detailed specific mitigation cannot be developed at this stage in the first iteration DWMP process, in the absence of locational data, data pertinent to the solution size, design and its construction for example. Only once these are known can the full extent of the impacts be understood and mitigation appropriately identified.

It should be recognised that whilst adverse impacts, have been identified, these impacts are generally restricted to the construction stage and as such are temporary. Beneficial effects will be manifested during the operation stage and can be essentially considered permanent.

Table 12-1 – Typical Embedded Mitigation

Typical Mitigation		
Design	Construction	Operation
• Locate at distance from sensitive receptors • Consider potential for ecological enhancement • Consider compensatory green infrastructure • Careful site selection – avoid areas of better quality soils if possible and target previously used land • Consideration of character, setting, level of protection and potential need for conservation during planning and design • Sustainable design measures • Community engagement throughout the process	• Integration of Construction Environmental Management Plan • Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations • Appropriate management of invasive species • Care of topsoil for future reuse • Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the environment is maintained as far as practical during construction • Consideration of waste hierarchy and Use of recycled or re-used materials in a Site Waste Management Plan (SWMP) • Precautions for unexpected heritage discovery during construction • Adherence to all relevant health and safety measures	• Regular programme of maintenance and monitoring to ensure operation at most efficient level • Scheduled control of invasive species where necessary

13. Cumulative, Synergistic and Indirect Effects

13.1. Introduction

Through any SEA based approach, there is a requirement to consider cumulative, synergistic and indirect effects of implementation of the DWMP. Secondary and indirect effects are effects that are not a direct result of the DWMP, but which occur away from the original effect or as the result of a complex pathway. Cumulative effects arise where several proposals or elements individually may or may not have a significant effect, but in combination have a significant effect due to spatial crowding or temporal overlap. Synergistic effects are when two or more effects act together to create an effect greater than the simple sum of the effects when acting alone.

13.2. Likely cumulative effects

SEA Objectives which have the potential for significant cumulative effects have been identified from the analysis of plans and programmes, the baseline data and an examination of the identified key issues and cumulative, synergistic and indirect effects have also been considered during the assessment.

13.2.1. In-plan cumulative effects

The results of the effects of the DWMP proposals are discussed in Chapter 10, 11 and supported by Appendices Volumes 2-6. As noted, it is not possible at this stage to identify precisely where within a catchment a proposed GSO will be located, or the precise scale and nature of these GSO's. As such, it is only possible to identify generic anticipated cumulative effects at this stage. Precise cumulative effects will be identified when more detail of individual GSO's and their precise locations become known and will be explored in more detail in future iterations of the DWMP. Nevertheless, it is anticipated that the proposals can interact cumulatively across environmental issues as shown in Table 13-1. These relate to flooding, water quality, biodiversity, soil and population and human health.

It is anticipated that the remaining SEA topics will not be impacted significantly, and any effects are likely to be felt in the short term / construction period only. As such, the potential neutral or slight beneficial or adverse cumulative effects have not been detailed for air quality, carbon emissions, landscape, soil, material assets or cultural heritage.

Table 13-1 - In Plan Cumulative Effects

Effects	Causes	Significance
Flooding	It is considered the DWMP could have an overall beneficial effect in terms of flooding, as across the Plan area are a range of GSO's to help alleviate known flooding problems. While the scale of such schemes is not yet known, it is anticipated that reduced capacity pressures and therefore reduced surface water flooding across a significant proportion of the catchments will provide a wider benefit for the entire Plan area. Whilst there are adverse effects associated with the construction of the individual schemes, construction is likely to take place at different times and within different catchments and will be most likely relatively small scale in discrete locations. The cumulative impact of	The effects are anticipated in the long term/operational stages and represent major beneficial effects. Slight adverse effects are considered most likely in the short term (during construction).

	construction activities will therefore be significantly reduced.	
Water Quality	It is considered the DWMP is likely to have an overall positive impact on water quality. The beneficial effect will be derived from a clear focus on reducing the amount of Unsatisfactory Intermittent Discharges from sewage treatment works to receiving waterbodies (particularly on sensitive receiving waters and/or bathing waters) and reduction in flooding. Whilst there is the potential for adverse effects on water quality during the construction of certain schemes, construction will take place at different times and within different catchments and will be most likely relatively small scale in discrete locations. Any adverse cumulative impact of construction activities will therefore be significantly reduced.	The effects are anticipated in the long term/operational stages and represent major beneficial effects. Slight adverse effects are considered most likely in the short term (during construction).
Biodiversity	It is considered that the DWMP could have an overall beneficial effect in terms of biodiversity given the Plan aims to reduce capacity pressures within the wastewater network and thus flooding across a significant proportion of the catchment. Reduced flooding will have a positive effect on biodiversity and a wider benefit for the entire Plan area cumulatively. In addition, improving the performance of wastewater assets to treat and dispose of sewage in line with the discharge permit conditions imposed on sewage treatment works across the plan area will cumulatively improve water quality and therefore aquatic biodiversity within the water bodies to which they discharge (in particular sensitive receiving waters and/or shellfish waters) Whilst there are adverse effects associated with the construction of the individual schemes, construction will take place at different times and within different catchments and will be most likely relatively small scale in discrete locations. The cumulative impact of construction activities will therefore be significantly reduced.	Adverse effects are considered most likely in the short term (during construction), with major beneficial effects more likely to be experienced in the long term/operational phase.
Population and human health	It is anticipated that the DWMP will likely act to improve human health (including wellbeing) through reducing the percentage of people within the plan area at risk of out of sewer flooding, the number of internal flooding incidents per year (hydraulic overload and other causes) and any impact from sewage treatment work Unsatisfactory Intermittent Discharges to bathing waters. Whilst there are adverse effects associated with the construction of the individual schemes, construction will take place at different times and within different catchments and will be	The effects are anticipated in the long term/operational stages and represent moderate beneficial effects. Slight adverse effects are considered most likely in the short term (during construction).

	most likely relatively small scale in discrete locations. The cumulative impact of construction activities will therefore be significantly reduced.	
Air Quality	Construction techniques have the potential to give rise to short term adverse effects on air quality. This includes dust emissions and tailpipe emissions from construction plant. Whilst there are adverse effects associated with the construction of the individual schemes, construction will take place at different times and within different catchments and will be most likely relatively small scale in discrete locations. The cumulative impact of construction activities will therefore be significantly reduced.	Slight adverse effects are considered most likely in the short term (during construction).

13.2.2. In-combination cumulative effects with other plans and projects

The SEA has also considered other plans and projects that might lead to cumulative effects when combined with the DWMP, as noted in Table 13-2.

Table 13-2 - Cumulative effects with other plans and projects

Plan	Overview	Potential for cumulative effects with DWMP
Range of other water related Plans and Policies within the Plan Area e.g. TW Water Resource Management Plan and Drought plan	The WRMP sets out how TW aims to continue to provide a secure and sustainable water supply for their customers and protect the environment. The TW Drought plan sets out the actions required in the event of a drought to maintain essential supplies of water while protecting the environment (leak reduction, reducing water pressure, temporary use bans etc)	It is anticipated that cumulative beneficial effects on water quality from, for example, demand management measures in Thames Water's Drought Plan and TW WRMP in terms of the reduction in the growth of water abstraction from the water environment, as well as lower energy use and carbon emissions from reduced water pumping and treatment will be experienced in the long term/operational phase.
Range of other water related Plans and Policies in neighbouring Areas e.g. WRMPs, DWMPs or Drought plans	As with such Plans within the Thames Water area, it is anticipated there is a potential for interaction with neighbouring areas.	It is anticipated that while there is the potential for adverse effects, particularly during the construction phase, ultimately such plans will result in cumulative beneficial effects to the water environment.
Local Authority Development Plans related to residential, commercial and industrial development.	Local Authorities within and adjacent to the DWMP area set out how development will be undertaken within their areas of responsibility and such development could interact with solutions proposed within the DWMP.	It is anticipated that cumulative effects are likely to be a mix of adverse and beneficial. It is to be noted though that the DWMP will form an important component of ensuring that such developments can take place with appropriate wastewater infrastructure.

There are a wide range of major developments or infrastructure projects underway or expected to commence within the Plan area, alongside more typical small scale 'day to day' developments. Noted specific examples include (but are not limited to) M25 RTMC Replacement, HS2, Crossrail, Lower Thames Crossing, as well as broader developments such as through the Affordable Homes Programme, wider transport infrastructure, energy and utilities sectors. As noted by the Infrastructure and Projects Authority⁵, over the next 10 years (from 2021), total infrastructure investment is expected to be nearly £650 billion.

Each of the noted schemes (along with other developments not noted) will require significant construction activities.

While locationally spread across the Region (and beyond) and likely to be constructed at varying periods, such schemes have the potential to interact with GSO's derived from the DWMP and have a cumulative effect on sustainability (beneficial or adverse). At this stage of DWMP development it is not possible to ascertain where such DWMP GSO solutions may be located, their nature or scale.

Nevertheless, it is anticipated that due to the approach set out in the DWMP for further ongoing assessment, as well as likely need for EIA and Environmental Management Plans as part of the general Planning process, mitigation measures can be taken to minimise adverse effects and maximise beneficial effects.

It is anticipated that cumulative effects are likely to be a mix of adverse and beneficial.

⁵ Analysis of the National Infrastructure and Construction Pipeline 2021

14. Monitoring

The SEA Regulations state that *‘the responsible authority shall monitor the significant environmental effects of the implementation of each plan or programme with the purpose of identifying unforeseen adverse effects at an early stage and being able to undertake appropriate remedial action’ (Part 4 Post Adoption Procedures Regulation 17). In addition, the Environmental Report should provide information on a ‘description of the measures envisaged concerning monitoring’ (Schedule 2 Information for Environmental Reports).*

In line with the SEA Regulations, Thames Water are considered the ‘responsible authority’ as they are the body by which the DWMP is prepared. Monitoring will cover significant social, environmental and economic effects and it will involve measuring indicators that will enable the establishment of a causal link between the implementation of the DWMP and the likely significant effects (both positive and negative) being monitored.

At this stage, it is not possible to determine a fully detailed monitoring programme or a full list of metrics, as this will be determined through further development of the DWMP and will be outlined in detail in future iterations. However, at this stage it is anticipated that likely monitoring metrics would include, as a minimum, those metrics currently utilised by Thames Water as part of their wastewater / drainage monitoring programme.

The SEA Regulations expect that monitoring should focus on the significant negative effects identified through the assessment. The UK Water Industry Research (UKWIR) guidance recommends that existing arrangements for monitoring should be used where possible to avoid duplication of effort. As such, note has been made of the proposed monitoring outlined in Thames Water’s draft Water Resource Management Plan 2024, in order to ensure that there is synergy with that water management plan and ensure that monitoring across environmental objectives is as effective as possible.

As well as utilising existing and proposed Thames Water monitoring, note that some elements of the monitoring proposed below (Table 14-1) will require liaison with bodies such as Historic England, Environment Agency, Natural England and Local Authorities and utilisation of data derived from their monitoring activities.

14.1.1. Proposed Monitoring

SEA Topic	Objective	Overview of typical effect	Requirement for monitoring
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Construction and operation of the wastewater drainage network can have implications for biodiversity, for example through loss of habitat or disturbance to species. There is a potential that invasive species can spread through activities associated with wastewater treatment or disposal, or through activities such as maintenance.	Area (Ha) of designated site (including geological sites) directly affected by DWMP Options Condition of statutory and non-statutory ecological sites Sites of Special Scientific Interest (SSSI) monitoring % of Invasive and Non-Native Species (INNS) risks mitigated Ecological status of water bodies
	To strengthen the connections between people and nature and realise the value of biodiversity		Area of Blue and Green Infrastructure created, % of habitat creation or existing habitat enhancement
Population and Human Health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Construction activities could result in direct and indirect effects on health and wellbeing, as well as impact on access to community facilities or provision of services. Inadequate treatment and inappropriate disposal of wastewater can have direct implications for health.	Number of complaints and customer satisfaction through surveys and reporting through Thames Water's annual performance processes. Level of disruption due to construction and operational works (where relevant).
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial	Construction and operation of wastewater treatment and disposal infrastructure typically requires large amounts of material assets and resources and can result in large amounts of waste being generated.	% of A-Rated, recycled, reused material used in infrastructure options.

	consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill		Number of options that utilise existing infrastructure. Volume of waste generated. Waste disposal method by %
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Construction and operation of the wastewater drainage network can have a wider range of effects on the water environment, resulting in changes in water quantity and quality within the environment. Increased occurrence of extreme weather events due to a changing climate could increase flood risk, or increase the area at risk of flooding. Flood risk can also occur due to the increase in areas of hardstanding or loss of floodplain due to the construction of infrastructure, including that related to wastewater disposal infrastructure.	Chemical status of water bodies. Changes in WFD condition status (both positive and negative) of surface and groundwater bodies. No. of pollution incidents (both during construction and operation)
	To reduce and manage flood risk		% of flood risks noted in Flood Risk Assessment (FRA) for projects mitigated
Soil	To protect and enhance geology, the quality and quantity of soils, and promote a catchment-wide approach to land management	Soil is a non-renewable resource and is vulnerable to erosion, degradation and contamination. Valuable soil resources can be lost or degraded due to construction of water drainage infrastructure. Pollution incidents during construction and operation can lead to contamination of the soil resource	Area of Best and Most Valuable soils (Grade 1 to 3a) lost to and restored by DWMP options Total area of soil reinstated for agricultural use No. of pollution / contamination incidents during construction or operation of the wastewater disposal infrastructure
Air and Climate	To reduce air pollutant and greenhouse gas emissions	As with air and noise, construction activities are likely to result in carbon emissions. Options would also result in embedded carbon,	Local air quality monitoring during construction phase % Energy supplied by renewable sources.

		but also potentially ongoing emissions through the requirement for energy for pumping / treating water The climate is changing. This is anticipated to result in more extreme weather events which could disrupt or destroy infrastructure, including that related to wastewater drainage, on a more frequent basis.	Reduction of wastewater operational emissions Number of projects that are able to utilise existing infrastructure Carbon emissions from company operations Company vehicle fleet fuel consumption
	To adapt and improve resilience to the threats of climate change		% of climate risks mitigated No. of days / hours when wastewater infrastructure disrupted (loss of service) due to extreme weather events
Historic Environment	To conserve and enhance the historic environment, the heritage assets therein and their setting	Construction activities can lead to effects on historic assets, including unknown artefacts though reinstatement would remove these effects or provide opportunities to improve the setting of these assets. Dewatering of areas during construction could damage buried assets. Archaeological investigation may provide opportunities to understand the past history of the Thames Water area better	Condition of historic assets, including heritage at risk No. of historic assets damaged or enhanced by options in the DWMP
Landscape	To protect, enhance the quality of, and improve access to, designated and undesignated landscapes, townscapes and the countryside	Construction activities can have a detrimental, though typically temporary, impact on visual amenity, particularly if these are over large areas such as due to a pipeline. The requirement for new or enhanced infrastructure can result in new elements being added to the landscape.	No. of DWMP options that require additional landscaping

15. Summary and Conclusions

The environmental assessment process carried out throughout the development of the DWMP has been thorough and comprehensive. Iterations of solution (known as GSO's) development / proposals have been subject to review by the environmental assessment team and continuous dialogue took place with the DWMP development team. It is considered that this resulted in an enhanced incorporation of environmental considerations and aided a much greater understanding of environmental and social issues within individual catchments as the draft DWMP evolved.

A key limitation to the assessment is that specific locational detail is not yet known in respect of the proposed GSO's to the wastewater and drainage issues within the DWMP area. While the type of GSO's to be implemented within each catchment are known, there is no further detail on the precise location, scale and nature of each of the proposed GSO's. This has meant that the results of the assessment are necessarily high level and generic. Further, more detailed assessment of all the issues raised and identified within this assessment approach will be required as the DWMP is developed in future iterations, with this process continuing through the detailed design and solution implementation phases.

In order to ensure full consideration of environmental issues and in order to ensure alignment with other recognised assessment approaches within the water industry, the assessment approach taken was based on that undertaken for Strategic Environmental Assessment. This approach allows for early consideration of environmental and social topics and the integration of these into the plan development, and as such, helps demonstrate that the DWMP delivers the best, sustainable outcomes for customers, stakeholders and the environment. This SEA based approach allowed for the identification of a series of environmental objectives that could be applied across all catchments and all solution types within the Plan.

Due to the large number of catchments within the Plan area (with over 300 examined), as well as the large number of potential GSO's (in excess of 40 different types), the assessment process utilised a GIS based approach that allowed for consistency of assessment across the Plan and robustness of assessment findings. The foundation to this GIS exercise was a large number of environmental data layers to allow identification of environmental issues within each catchment, London risk zone and existing sewage treatment works catchments. Applying a series of rules to these data sets, based on the assessment framework identified through a review of baseline information as well as a review of relevant plans and policies, allowed for the environmental sensitivity of each catchment, in respect of each environmental topic, to be understood.

In terms of each GSO, utilising a technical understanding of each GSO type, it was possible to determine the likely magnitude of effect of implementing that GSO, in respect of each environmental topic. This understanding of GSO implementation magnitude, combined with the sensitivity of the catchment, meant that it was possible to identify anticipated likely significant effect (beneficial or adverse) for each environmental topic.

Utilising this approach, and based on the findings of the environmental assessment, it is possible to draw a number of key considerations in relation to the DWMP and the likely significant effects that can be anticipated from its implementation.

- Significant beneficial effects are likely across a majority of catchments
- Significant beneficial effects identified are likely to be long term
- Significant beneficial effects stem from GSO's that will reduce frequency and severity of spills from the wastewater network (including combined sewer overflow events); reduce and improve resilience to flooding; improve quality of effluent discharges and improve capacity and efficiency of wastewater networks and processes.
- Beneficial effects are anticipated across a range of environmental topics such as biodiversity, water quality, flood risk, material assets, climate change and human health.
- Adverse effects are considered most likely in the construction phase, due to the construction / implementation activities required. These adverse effects are focused on a small range of environmental topics such as biodiversity, soils and landscape.

These environmental assessment findings were communicated to the DWMP development team and were incorporated into the Programme Appraisal and ultimately helped inform identification of the Final Plan.

It is to be recognised that the GSO's proposed will, to a greater or lesser degree, require installation or construction works. Such activities have the potential to cause environmental issues, for example through loss of habitat, disturbance to species or people, increased potential for pollution incidents and so on. For these

reasons, it is anticipated that most of the adverse effects identified through the assessment process are likely to take place during the construction phase and to be temporary to that phase. In order to ensure that such adverse effects are minimised, a range of suitable mitigation has been identified and it is important that this is further developed as more details of the proposed GSO's and precisely where they are to be located become known. Avoidance is always better than applying mitigation and this, alongside taking opportunities to maximise beneficial effects, should be a key consideration in any further development or future iteration of the DWMP. It is the intention that the results of this assessment process, along with the key outputs such as the catchment maps that depict environmental constraints alongside the catchment proformas which provide more detail on these constraints within each catchment, should be used as a building block upon which further consideration of GSO implementation should be made.

The assessment undertaken recognises that the range of GSO's within the DWMP, when implemented across the catchments within the Plan area, have the potential for cumulative effects. However, it is to be recognised that not all of the GSO's will be implemented within the same timeframe and there will be a certain amount of spatial distancing as work takes place across catchments. Development of the GSO's will also take place within a planning framework that will require the implementation of a range of mitigation measures. These measures will act to reduce or nullify the potential for adverse cumulative effects during construction. Once GSO's are operational, it is anticipated that there is a potential for beneficial cumulative effects on the plan area across a range of environmental topics such as flooding, water quality, biodiversity and health.

The DWMP will also not operate in isolation. There are a number of known major infrastructure projects taking place across the region, alongside the wide range of typical, smaller 'day to day' developments. These projects also have the potential for cumulative effects with the DWMP, particularly during the construction stage. While it is not possible at this stage to determine where such developments are located in relation to DWMP GSO's, it is to be recognised that such schemes will also be developed within a wider planning context and with mitigation to reduce or nullify adverse effects applied – particularly for those larger scale infrastructure developments that are likely to have been subject to Environmental Impact Assessment. Further assessment will clarify the full potential for such cumulative effects.

Recognition of the potential for ongoing effects from implementation of the DWMP requires the monitoring of significant social, environmental and economic effects and as such, will involve measuring indicators that will enable the establishment of a causal link between the implementation of the DWMP and the likely significant effects (both positive and negative) being monitored. In short, this will allow steps to be taken to address issues immediately, should they arise. It will also allow for a body of evidence to be gathered that will be directly relevant to the DWMP and as such, will be of immense value to inform further iterations of the Plan.

Overall, it is considered that the GSO's proposed within the DWMP offer the potential for beneficial effects across a range of environmental topics. While there are likely to be adverse effects, particularly during construction, it is anticipated that these can be reduced or nullified through mitigation. Maximising the beneficial effects while minimising the adverse will be a key focus of further DWMP development. While limitations in the assessment are highlighted, it is hoped that this work will provide the foundation for further, more detailed assessment as, for example, location and scale of interventions become known. In highlighting areas of potential risk, opportunity and mitigation requirements, this work should act also as a key resource to inform the design process, including site selection and scaling, ultimately helping to steer the further development of the Plan to ensure environmental considerations continue to remain at the forefront.

Appendix A. Baseline and Key Environmental Issues

Note all counts are approximate. For clarity, where there are instances of designated sites made up of multiple component areas, such as the Thames Basin Heaths SPA (which is made up of over 60 separate polygons) this is recorded as one site.

Table 1 - Biodiversity

	International / National (UK & England)	Regional (South East Region)	Local (Plan Area)
Special Protection Areas (SPA's)	As of November 2021, there were 86 Classified SPAs in England, covering an area of 1,097,850.40 ha¹. There is one site crossing the England / Scotland border (135,807 ha), two across the England / Wales border (38,810 ha), one classified as England / Wales / Offshore (252,311 ha) and two classified as England / offshore (745,722 ha). SPAs in England are predominantly located in coastal and estuarine areas, with various sites distributed inland².	As of November 2021, there are 25 classified SPAs within the South East region of England - Dungeness, Romney Marsh and Rye Bay designated for its tern breeding colonies; - Upper Nene Valley Gravel Pits designated as an area for breeding, wintering and migration of rare and vulnerable species of bird; - Thanet Coast & Sandwich Bay is designated for supporting populations of Turnstone; - Benfleet and Southend Marshes was designated for its internationally important populations of regularly occurring migratory species; - Blackwater Estuary (Mid-Essex Coast Phase 4) has been designated for wintering waterbirds. - New Forest designated for its breeding colonies; - Portsmouth Harbour due to internationally and nationally important numbers of birds and specifically protects the following features: dark-bellied Brent goose; red-breasted merganser; dunlin; and black-tailed godwit;	As of November 2021, within the Plan Area there are 9 classified SPAs. - Thames Basin Heath – is one of the South East's most important natural assets with the lowland heath supporting important populations of Dartford Warbler, Nightjar and Woodlark - vulnerable ground-nesting birds and is located to the south in the plan area. - Wealden Heaths Phase II – is designated for its support to breeding bird populations of European importance located to the south in the plan area. - South West London Waterbodies - is designated for internationally important numbers of wintering Gadwall and Shoveler and is located to the south in the plan area. - Salisbury Plain - is designated for breeding Stone Curlew populations and located to the south west in the plan area. - Arun Valley- is designated as being of international importance for the breeding, feeding, wintering or the migration of rare and vulnerable

¹ Natural England (2021) *Designated Sites View*. Available <https://designatedsites.naturalengland.org.uk/ReportConditionSummary.aspx?SiteType=SPA>

² Joint Nature Conservation Committee JNCC (2020) *Special Protection Areas – overview*. Available <https://jncc.gov.uk/our-work/special-protection-areas-overview/>

- **Chichester and Langstone Harbours** designated as an area for breeding and wintering of species of bird;
- **Foulness (Mid-Essex Coast Phase 5)** designated for its breeding and non breeding colonies;
- **Crouch & Roach Estuaries (Mid-Essex Coast Phase 3)** designated for the dark-bellied brent goose (Non-breeding);
- **Medway Estuary & Marshes** designated for breeding and non-breeding populations and regularly occurring migratory bird species;
- **Thames Estuary & Marshes** is designated for its wetland that supports important numbers of wintering waterbirds and migrating birds;
- **The Swale** is designated for its non-breeding colonies;
- **South West London Waterbodies** - is designated for internationally important numbers of wintering Gadwall and Shoveler;
- **Salisbury Plain** - is designated for breeding Stone Curlew populations;
- **Arun Valley** - is designated as being of international importance for the breeding, feeding, wintering or the migration of rare and vulnerable species of birds;
- **Pagham Harbour** - is designated for populations of Annex I and migratory

species of birds and located to the south in the plan area.

- **Pagham Harbour** - is designated for populations of Annex I and migratory bird species and supporting their survival and reproduction, located to the south.
- **Lee Valley** - is designated for its support to breeding bird populations and is located to the south east in the plan area.
- **Thursley, Hankley & Frensham Commons** - is designated for its population of breeding Nightjar *Caprimulgus europaeus*, Woodlark *Lullula arborea* and Dartford warbler *Sylvia undata*.
- **Porton Down** – is designated for its important breeding populations of Stone-curlew *Burhinus oedicephalus*, Quail *Coturnix coturnix*, Hobby *Falco subbuteo*, and over-wintering Hen harrier *Circus cyaneus* located in the south west of the plan area.

- bird species and supporting their survival and reproduction;
- **Lee Valley** - is designated for its support to breeding bird populations; and
- **Porton Down** – is designated for its important breeding populations of Stone-curlew *Burhinus oedicephalus*, Quail *Coturnix coturnix*, Hobby *Falco subbuteo*, and over-wintering Hen harrier *Circus cyaneus*.

Explanatory Text and anticipated future trends:

Special Protection Areas (SPAs) are protected areas for birds in the UK. SPAs are classified in accordance with European Council Directive 2009/147/EC on the conservation of wild birds, known as the Birds Directive. SPAs protect rare and vulnerable birds (as listed on Annex I of the Birds Directive), and regularly occurring migratory species. JNCC³ is responsible for advising the UK Government and Devolved Administrations on aspects of the classification and management of SPAs from a UK perspective, including reporting on the implementation of the UK SPA programme and the status and trends of protected bird species. New potential Special Protection Areas (pSPAs) for classification or updates to existing SPAs are submitted in tranches.

The UK's Statutory Nature Conservation Bodies (SNCBs) are responsible for assessing the condition of SPAs. Approximately 41% of all SPA's in England are classified as being in favourable condition, with 51% classed as unfavourable but recovering. Approximately 2.8% of SPAs are in a declining condition with 0.03% being partially destroyed.

Anticipated Future Trends⁴:

- The composition of flora and fauna on each Protected Area (PA) will change – high confidence (medium evidence, high agreement)
- Cold adapted species of high latitudes and altitudes will tend to decrease on PAs, whilst warm adapted species will tend to increase – medium confidence (medium evidence, medium agreement)
- PAs in the North of the UK will gain plant species overall, whilst PAs in the south may lose some native plant species. This pattern is reversed for UK breeding birds – low confidence (medium evidence, low agreement)
- Species with lower dispersal capacities and those for which urban and intensive agricultural areas are a barrier to dispersal will be unable to colonize PAs that become climatically suitable – low confidence (limited evidence, medium agreement)
- Increasing range mismatching of interacting species, such as butterflies and their host plants, might mean that more management is necessary on PAs to preserve species that interact with each other – low confidence (limited evidence, medium agreement).

³ Joint Nature Conservation Committee JNCC (2020) *Special Protection Areas – Overview*. Available: <https://jncc.gov.uk/our-work/special-protection-areas-overview/>

⁴ Bournemouth University (2015) *Biodiversity Report Card*. Available: <https://nerc.ukri.org/research/partnerships/ride/lwec/report-cards/biodiversity-source04/>

Integrating consideration of climate change into management plans for the PA network is likely to result in more effective (and cost-effective) conservation solutions. In order to facilitate this integration, monitoring of climate change impacts and management actions should be carried out to enable adaptive decision making.

Special Areas of Conservation (SAC's)	As of November 2021, there were 256 SACs in England, covering an area of 5,748,138 ha ⁵ . There are no SCI's. There are three SACs crossing the England / Scotland border (112,770 ha) and seven across the England / Wales border (95,182 ha). Additionally, there are three SACs which are classified as England / offshore (3,795,179 ha) and one England / Wales / Offshore (584,989 ha) ⁶ . SACs are widely distributed throughout England; however, the highest concentrations correspond with the more remote rural and upland locations.	There are 69 classified SACs in the South East Region of England.	Within the Plan Area there are 39 classified SACs. Some of the more prominent SAC's within the region are; • Salisbury Plain • Thursley, Ash, Pirbright & Chobham • Chilterns Beechwoods

Explanatory Text and anticipated future trends:

SACs are strictly protected sites designated under the EC Habitats Directive. Article 3 of the Habitats Directive requires the establishment of a European network of important high-quality conservation sites that will make a significant contribution to conserving the 189 habitat types and 788 species identified in Annexes I and II of the Directive (as amended). The listed habitat types and species are those considered to be most in need of conservation at a European level (excluding birds). Sites of Community Importance (SCIs) are sites that have been adopted by the European Commission but not yet formally designated by the government of each country. Candidate SACs (cSACs) are sites that have been submitted to the European Commission, but not yet formally adopted. JNCC is responsible for advising the UK Government and devolved administrations on aspects of the designation and management of SACs from a UK perspective.

SACs are of national and international conservation importance.

Approximately 35% of all SACs in England are classified as being in favourable condition, with 58% classed as unfavourable but recovering. Approximately 2% of SACs are in a declining condition with 0.03% being partially destroyed.

Anticipated Future Trends⁷:

See above details that are applicable to all forms of PA.

⁵ Natural England (2021) Designated Sites View. Available: <https://designatedsites.naturalengland.org.uk/>

⁶ Joint Nature Conservation Committee JNCC (2020) Special Areas of Conservation – overview. Available: <https://jncc.gov.uk/our-work/special-areas-of-conservation-overview/>

⁷ <https://nerc.ukri.org/research/partnerships/ride/lwec/report-cards/biodiversity-source04/>

Marine Conservation Zones (MCZs)	Marine Conservation Zones are areas that protect a range of nationally important, rare or threatened habitats and species. There are 91 MCZs in waters around England. These are spread across the English coastline but there are concentrations along the English Channel and South West.	Marine Conservation Zones in waters off the South East of England include, but are not limited to: - Goodwin Sands - Foreland - Folkestone Pomerania - Inner Bank - Beachy Head East - Offshore Brighton - Offshore Overfalls - Kingmere - Bembridge - Thanet Coast	The Plan Area is partially intersected by the following MCZs: - Pagham Harbour – it protects features within the harbour area, Ferry Pool lagoon and Church Norton spit covering a total area of nearly 3 km² - Swanscombe - covers an area of approximately 3 km² and is located within the Thames estuary
Explanatory Text and anticipated future trends: The government aims to have ‘clean, healthy, safe, productive and biologically diverse oceans and seas’. The government has made a commitment to completing a network of Marine Conservation Zones (a type of Marine Protected Area), to create a Blue Belt of protected sites around our coasts. <u>Anticipated Future Trends⁸:</u> Increasing marine development, pollution, fishing practices and climate change place pressure on MCZs and wider marine habitat and wildlife. Management measures may be required in order to restore or maintain the conservation status of the protected features of MCZs. See above details that are applicable to all forms of PA.			
Sites of Special Scientific Interest (SSSI) NB. The SSSI information shown includes sites designated for both biological	There are over 4,100 SSSIs in England, covering about 1,099,505 ha⁹. Some of these sites correspond with other designations, such as SACs, SPAs and NNRs. SSSIs are widespread throughout the whole of England and cover a wide variety of habitats and geological features.	There are 1,189 classified SSSIs in the South East Region of England.	There are 778 classified SSSI's within the Plan Area. These SSSIs are each associated with Impact Risk Zones for a broad range of development proposals including those relevant to the water sector (large infrastructure, waste treatment, proposals to discharge water or liquid waste to ground, landfilling, incineration, development that may lead to air and dust pollution, large non

⁸ <https://nerc.ukri.org/research/partnerships/ride/lwec/report-cards/biodiversity-source04/>

⁹ Natural England (2016) *Designated Sites View*. Available: <https://designatedsites.naturalengland.org.uk/>.

and geological reasons.			residential developments outside existing settlements).
Explanatory Text and anticipated future trends: A Site of Special Scientific Interest (SSSI) is a formal conservation designation of national importance. Usually, it describes an area that's of particular interest to science due to the rare species of fauna or flora it contains - or even important geological or physiological features that may lie in its boundaries. SSSIs often contain important habitats such as grasslands, parkland and woodland. Some even contain ancient woodland and ancient trees. In other words, these areas have high conservation value, and need to be protected. Official authorities in each country determine which sites should have SSSI status, for England this is Natural England. Approximately 39% of all SSSIs in England are classified as being in favourable condition, with 53% classed as unfavourable but recovering. Approximately 3% of SSSIs are in a declining condition with 0.03% being partially destroyed. Natural England have also developed SSSI Impact Risk Zones (IRZs) which allow for a rapid initial assessment of the potential risks to SSSIs posed by development proposals. They define zones around SSSI which reflect the particular sensitivities of the features for which it is notified and indicate the types of development proposal which could potentially have adverse impacts. IRZs for a broad range of development proposals have been identified within the Plan Area including those relevant to the water sector including large infrastructure projects, waste treatment, proposals to discharge water or liquid waste to ground, landfilling and incineration, development that may lead to air and dust pollution and large non residential developments outside existing settlements). <u>Anticipated Future Trends¹⁰:</u> See above details that are applicable to all forms of PA.			
Ancient Woodland & Veteran trees etc.	The Ancient Woodland Inventory for England identifies over 52,000 ancient woodland sites in England¹¹, covering 340,000 Ha. Ancient Woodland sites are scattered throughout England, with the densest concentrations being in the south east¹². Throughout England there are several trees classed as Veteran trees, which are classes as ancient tree, veteran tree and notable tree status. Some of the Veteran trees have	Woodland natural capital stocks cover approximately 13.5% of the South East region and consist of several sub habitat types including Broadleaved, mixed and yew woodland, Coniferous woodland, Individual trees/veteran trees and Woodland priority habitats¹⁴.	The Ancient Woodland Inventory for England identifies over 2,300 sites of Ancient Woodland, within the Plan area. Some areas have been continuously wooded since at least 1600AD are scattered across the plan area.

¹⁰ <https://nerc.ukri.org/research/partnerships/ride/lwec/report-cards/biodiversity-source04/>

¹¹ Natural England (2016) *Ancient Woodland Inventory (provisional for England – Digital Boundaries)*. Available: http://www.gis.naturalengland.org.uk/pubs/gis/tech_aw.htm

¹² Defra (2016) *MAGiC – Ancient Woodland (England)*. Available: <http://magic.defra.gov.uk/MagicMap.aspx>

¹⁴ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](#)

been removed over the years and these have been marked as lost trees¹³.

Explanatory Text and anticipated future trends:

Ancient woods are areas of woodland that have persisted since 1600 in England and Wales, and 1750 in Scotland. They are relatively undisturbed by human development. As a result, they are unique and complex communities of plants, fungi, insects and other microorganisms. Ancient woodlands can be classified into different categories, including Ancient semi-natural woods (woods that have developed naturally) and plantations on ancient woodland sites (ancient woodlands that have been felled and replanted with non-native species). Ancient woodland is identified using presence or absence of woods from old maps, information about the wood's name, shape, internal boundaries, location relative to other features, ground survey, and aerial photography. The Forestry Commission is responsible for protecting, expanding and promoting the sustainable management of woodlands.

Approximately 1,225 ancient woodlands are under threat in the UK due to conifer plantations, overgrazing, infrastructure development and the spread of invasive species.

Anticipated Future Events:

See above details that are applicable to all forms of PA. In addition to the threat of climate change, ancient woodlands are at particular threat from major infrastructure projects, including road and rail schemes. Whilst many schemes take part in some form of habitat regeneration (such as replanting), the replacement habitat is not comparable to the ecological value of ancient woodlands that have been preserved since 1600. Once these habitats are removed, they cannot be replaced or regrown.

**Nature Reserves
(National and Local)**

National Nature Reserves (NNR)

As of November 2021, there are 225 NNRs in England, covering over 98,600 Ha of land¹⁵.

Local Nature Reserves (LNR)

As of November 2021, there are 1,680 LNRs in England¹⁶.

National Nature Reserves (NNR)

In the South East region of England, there are 52 NNR recorded:

Local Nature Reserves (LNR)

In the South East region of England, there are 623 LNR recorded.

There are 31 NNR recorded within the Plan Area

There are 410 LNR recorded in the Plan Area, most of which are situated to the south east of the plan area.

Explanatory Text and anticipated future trends:

National Nature Reserves (NNRs) were established to protect some of our most important habitats, species and geology, and to provide 'outdoor laboratories' for research. Natural England manages approximately two thirds of England's NNRs. The remaining reserves are managed by organisations approved by Natural England, such as the National Trust, Forestry Commission, RSPB, Wildlife Trusts and local authorities.

¹³ [Tree Search - Ancient Tree Inventory \(woodlandtrust.org.uk\)](https://www.woodlandtrust.org.uk/tree-search-ancient-tree-inventory/)

¹⁵ <https://www.gov.uk/government/collections/national-nature-reserves-in-england>

¹⁶ <https://designatedsites.naturalengland.org.uk/SiteList.aspx?siteName=&countyCode=&responsiblePerson=&DesignationType=LNR>

Approximately 53% of all NNRs in England are classified as being in favourable condition, with 39% classed as unfavourable but recovering. Approximately 4.5% of NNRs are in a declining condition with 0% being partially destroyed.

Local Nature Reserves (LNRs) are a statutory designation made under Section 21 of the National Parks and Access to the Countryside Act 1949 by principal local authorities. Parish and Town Councils can also declare LNRs, but they must have the powers to do so delegated to them by a principal local authority. LNRs are places with wildlife or geological features that are of special interest locally. They offer people opportunities to study or learn about nature or simply to enjoy it. They range from windswept coastal headlands, ancient woodlands and flower-rich meadows to former inner-city railways, long abandoned landfill sites and industrial areas now re-colonised by wildlife. They are an impressive natural resource which makes an important contribution to England's biodiversity.

Anticipated Future Trends:

See above details that are applicable to all forms of PA.

Ramsar Sites	As of November 2021, there are 73 Ramsar sites in England, covering an area of 404,248 Ha ¹⁷ .	There are 21 Ramsar sites in the South East region	There are 5 Ramsar sites in the Plan Area. These are; • Lee Valley - A series of embanked water supply reservoirs, sewage treatment lagoons, and former gravel pits extending along about 24km of the valley from near Ware southward to Finsbury Park in London • Arun Valley - Consists of three SSSIs in an area of wet meadows on the floodplain of the River Arun between Pulborough and Amberley, subject to occasional flooding, dissected by a network of ditches, several of which support rich aquatic flora and invertebrate fauna • Pagham Harbour - An estuarine harbour with shingle beaches, intertidal mudflats and saltmarsh, giving way to brackish marsh supporting reedbeds and damp pasture • South West London Waterbodies - Comprises a number of reservoirs and

¹⁷ Natural England (2021) Designated Sites View. Available: <https://designatedsites.naturalengland.org.uk/ReportConditionSummary.aspx?SiteType=RAMSAR>

former gravel pits in the Thames Valley adjacent to Heathrow Airport between Windsor and Hampton Court which support internationally important numbers of Gadwall *Anas strepera* and Shoveler *Anas clypeata*

- Thursley and Oakley Bogs - The site is a valley mire complex which occurs within a matrix of heathland, where drainage is impeded, and a deep layer of peat has built up from the remains of bog-moss *Sphagnum* spp. which forms much of the vegetation.

Explanatory Text and anticipated future trends:

Ramsar sites are wetlands of international importance designated under the Ramsar Convention. The initial emphasis was on selecting sites of importance to water birds within the UK, and consequently many Ramsar sites are also Special Protection Areas (SPAs) classified under the Birds Directive. Sites proposed for selection are advised by the UK statutory nature conservation agencies, or the relevant administration in the case of Overseas Territories and Crown Dependencies, co-ordinated through JNCC.

Approximately 57% of all Ramsar Site in England are classified as being in favourable condition, with 34% classed as unfavourable but recovering. Approximately 5% of Ramsar Sites are in a declining condition with 0% being partially destroyed.

Anticipated Future Trends¹⁸:

See above details that are applicable to all forms of PA.

RSPB Reserves

The RSPB's latest annual report states that there are 220 RSPB reserves in England, covering 158,725 Ha¹⁹.

There are approximately 37 RSPB Reserves located in the South East Region.

16 RSPB Reserve are located within the plan area:

- Hazeley Heath;
- The Lodge;
- Church Wood;
- Rye Meads;
- Pilsey Island;
- Barfold Copse;

¹⁸ <https://nerc.ukri.org/research/partnerships/ride/lwec/report-cards/biodiversity-source04/>

¹⁹ <https://www.rspb.org.uk/globalassets/downloads/annual-report-2020/rspb-annual-report-2020-interactive-pdf.pdf>

- Pulborough Brooks;
- Amberley Wildbrooks;
- Otmoor;
- Rainham Marshes;
- Farnham Heath;
- Normanton Down;
- Medmerry;
- Winterbourne Downs;
- Rowlands Wood; and
- Franchises Lodge.

Explanatory Text and anticipated future trends:

RSPB reserves are nature reserves run by the Royal Society for the Protection of Birds (RSPB); a non-statutory body incorporated by Royal Charter. RSPB reserves cover a broad range of habitat and landscapes, including heathland, estuaries, cliffs.

Anticipated Future Trends:

See above details that are applicable to all forms of PA.

**Woodland
Priority Habitat**

As of October 2021, 39% of total priority habitats in England are classified as deciduous woodland²⁰. The majority of woodland priority habitats are located in the South East of England.

Priority habitats make up 16.6% of the South East region equating to a total of 39,5109ha. Deciduous woodland accounts for the highest percentage of priority habitat in the region²¹.

Priority habitat within the Plan Area is anticipated to be in keeping with that reported at the regional and national level.

Explanatory Text and anticipated future trends:

Priority habitats can be designated as protected areas called Sites of Special Scientific Interest (SSSIs). They can also be outside of these SSSI protected areas but be under Higher Level Stewardship (HLS) or Countryside Stewardship (CS) agreements or fall within Forestry Commission (FC) 'Managed woodland'. Some priority habitats, however, fall outside of the protection of all these schemes.

Anticipated Future Trends:

See above details that are applicable to all forms of PA.

²⁰ https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/829194/2a_Priority_habitats_2019_rev.pdf

²¹ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](#)

Table 2 - Population and Human Health

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Population and Locations of Major Settlements	In mid- 2020, England had an estimated population of 56,550,138²². By 2043, it is expected that the population of England will be approximately 61,744,100; an increase of 9.7%. The proportion of those aged 65 and over is due to increase by 42.2% by 2043, the largest increase for any age category. Meanwhile, the proportion of those aged between 0-29 and between 30-64 will increase by 2.9% and 1.9%, respectively over the same period²³. The number of households in England is projected to increase by 1.6 million (7.1%) over the next 10 years, from 23.2 million in 2018 to 24.8 million in 2028²⁴. Growth in the number of households is fastest where the household reference person (HRP) is of older age; 64% of the total growth in households is accounted for by households where the HRP is aged 75 years or over. The number of people aged 75 years and over living on their own is projected to	Approximately 19 million people, equating to around 30% of the UK's total population, live within the South East region. Settlements within the region are diverse and range from large population centres such as London to small rural hamlets and seaside towns. Long-term population growth in the region is anticipated to be around four million²⁵.	Key Urban areas: • Wiltshire population of 500,024 • Barnet population of 395,869 • Croydon population of 386,710 • Newham population of 353,134 • Ealing population of 341,806 • Enfield population of 333,794 • Bromley population of 332,336 • Brent population of 329,771 • Wandsworth population of 329,677 • Lambeth population of 326,034

²² ONS – *Estimates for the Population for the UK, England, Wales, Scotland and Northern Ireland: Mid-2019 – April 2020 Local Authority District Codes Edition*. ²⁴ ONS – Household projections for England: 2018-based. Available: <https://www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationprojections/bulletins/householdprojectionsforengland/2018based#household-type-projections>

²⁵ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](#)

	increase by 461,000 in the 10 years to 2028.		
	Latest ONS figures for household projections in England show an indication of the future number of households in England and its regions and local authorities²⁶. These are used for planning in areas such as housing and social care. The latest household projections show a continued rise in the number of households in England, at a level closely in line with what was previously projected. There continues to be much variation across age groups, regions and household types. ONS project the majority of household growth over the next 10 years will be because of an increase in older households without dependent children, particularly those where the household reference person is aged 75 years and over. This shows the potential impact of an ageing population on future household formation. The South East Region is expected to see substantial population growth in the coming years, with the proportion of residents of an older age increasing in line with the trend across much of England. Development across the plan area needs to be particular considerate of this group in relation to the design of development and neighbourhoods as well as the accessibility of services and facilities. There will be a need to promote development which ensures the issue of isolation does not become more prevalent given the expected increase in the proportion of single person households among older people. Without a strategic approach to development, it is less likely that these challenges will be comprehensively met. The English indices of deprivation measure relative deprivation in small areas in England called lower-layer super output areas. The index of multiple deprivation is the most widely used of these indices. There are seven distinct domains of deprivation; Income, Employment, Health and Disability, Education and Skill Training, Crime, Barriers to Housing and Services and Living Environment. There are 32,844 Small Areas in England and deprivation is ranked relatively from 1st (most deprived SA) to 32844TH (least deprived). Deprivation is however dispersed across England and 61% of local authority districts contain at least one of the most deprived neighbourhoods in England²⁷.		
General Health	The Health Survey for England notes that in England, between 1993 and 2019, the proportion of adults reporting very good and good general health has stayed at similar levels. In 2019, 43% of adults reported that they had at least one longstanding illness. Among adults 16 and over, 68% of men and 60% of women were overweight or obese and among children, 18% of boys and 13% of girls were obese. 18% of men	The percentage of the South East population describe their general health as the following³²; • General health very good – 47% • General health good – 35% • General health fairly good – 13% • General health bad – 4% • General health very bad – 1%	Clinical Commissioning Groups intersecting the Plan area are as follows: NHS Basildon and Brentwood CCG NHS Cambridgeshire and Peterborough CCG NHS East and North Hertfordshire CCG NHS Gloucestershire CCG NHS Herts Valleys CCG NHS Oxfordshire CCG

²⁶ ONS – Household projections for England: 2018-based. Available: <https://www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationprojections/bulletins/householdprojectionsforengland/2018based#household-type-projections>

Explanatory Text and anticipated future trends:

²⁸ [Health Survey for England 2019 \[NS\] - NHS Digital](#)

²⁹ <https://www.ons.gov.uk/peoplepopulationandcommunity/birthsdeathsandmarriages/deaths/datasets/deathscausedbysuicidebyquarterinengland>

³⁰ <https://www.ons.gov.uk/peoplepopulationandcommunity/healthandsocialcare/healthandlifeexpectancies/bulletins/healthstatelifeexpectanciesuk/2017to2019>

³¹ <https://www.gov.uk/government/publications/alcohol-drugs-and-tobacco-commissioning-support-pack/drugs-commissioning-support-pack-2019-to-20-principles-and-indicators#:~:text=An%20estimated%20300%2C000%20people%20in,image%20and%20performance%2Denhancing%20drugs.>

The Health Survey for England monitors trends in the nations health and care, providing survey, interview and medical examination based findings on a range of topics including wight, eating disorders, behaviours (including smoking and alcohol consumption) and health issues (includes diabetes, hypertension and high cholesterol). As a society, people are living longer – life expectancy in England has reached 79.6 years for men and 83.2 for women. Inequalities however persist and the richest areas enjoy 19 more years in good health than those in poorest areas. The death rate for dementia and Alzheimer’s disease, already the leading cause of death in women is anticipated to become the leading cause of death in men and the number of people with diabetes is expected to increase by a million – from just under 4 million in 2017 to almost 5 million in 2035³³.

Community Features	Reported at Local level only	Reported at Local level only	Within the Plan Area the following areas of greenspace have been identified: • 2,840 no. Allotments; • 821 no. Bowling Greens; • 1,039 no. Cemeteries; • 89 no. Country Parks; • 592 no. Golf Courses; • 2 no. National Parks; and • 5 no. National Trails.
	Explanatory Text and anticipated future trends: There is increasing evidence that provision of areas of greenspace contribute to mental and physical wellbeing however access varies greatly depending on where people live. The most economically deprived areas often have less available public greenspace, meaning people in those communities have fewer opportunities to benefit. The Committee on Climate Change found that the total proportion of urban greenspace in England declined by 8 percentage points between 2001 and 2018. The Governments 25 Year Environmental Plan however acknowledges the essential role the natural environment and greenspace play in peoples physical and mental health and aims to improve population health and wellbeing by improving access to greenspace and delivering more good quality green infrastructure.		

Table 3 - Material Assets

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Water Treatment Works and Sewage	Population growth and climate change mean that the water sector in England faces growing pressure to address challenges such as water scarcity and environmental quality	Issues at the regional level are anticipated to be in keeping with that reported at the national level. Population growth and climate change will continue to put pressure on	Issues within the Plan Area are anticipated to be in keeping with that reported at the regional and national level. The DWMP

³³ [Current and future state of nation’s health revealed - GOV.UK \(www.gov.uk\)](https://www.gov.uk/government/statistics/current-and-future-state-of-nations-health-revealed)

Treatment Works	while improving the resilience of systems and services to customers ³⁴ .	areas, such as the south-east of England, where water resources are already scarce.	aims to resolve many of the capacity issues highlighted.
Explanatory Text and anticipated future trends: Supply and capacity issues within the existing Water Treatment Works and Sewage Treatment Works infrastructure across the region are anticipated to increase as growing population numbers and climate change place greater pressure on infrastructure and water supply. Development, in the Plan Area will need to respond to supply and capacity issues in terms of these types of infrastructure. In some instances, development may need to support the delivery of new infrastructure where supply and capacity issues emerge. Without a strategic approach to development, capacity issues in the region may prove more difficult to address in manner which benefits the highest number of residents in the plan area.			
Authorised and Historic Landfill Sites	Reported at Local level only	Reported at Local level only	There are approximately 3,700 historic landfill sites and approximately 330 authorised landfill sites within the Plan Area.
Explanatory Text and anticipated future trends: The amount of waste sent to landfill across England has remained relatively stable since 2009 although peaks in 2019 for the South East and East of England demonstrate demand continues to be high. While the South East is a region of significant landfill capacity (c. 27 million m3 of inert waste and 24 million m3 of non-hazardous waste)³⁵ the number of non-hazardous landfill facilities is declining across the South East and a lack of new capacity being allocated in Local Plans is noted³⁶.			
Major Utilities (major gas mains, overhead lines etc.)	There are currently eight gas terminals operating across the UK, seven of these are located in England and Wales along the west and east coast. National Grid is responsible for the transmission of gas across England. Currently there are four gas distribution networks across the UK ³⁷ .	N/A	The gas distribution operators in the Plan Area are SGN, Cadent and Wales and West Utilities and the electricity distribution operators are the UK Power Networks, Scottish and Southern Electricity Networks and Western Power Distribution³⁸. According to the National Grid Network Map, the Plan Area is intersected by cables and overhead powerlines throughout³⁹.

³⁴ https://www.ofwat.gov.uk/wp-content/uploads/2015/10/pap_tec201507challenges.pdf

³⁵ <https://www.letsrecycle.com/news/waste-to-landfill-in-england-jumps-4-in-2019/>

³⁶ <https://info.westberks.gov.uk/CHttpHandler.ashx?id=49719&p=0>

³⁷ Energy Network Association, Gas Transmission Map. Available: <https://www.energynetworks.org/operating-the-networks/whos-my-network-operator>

³⁸ <https://www.energynetworks.org/operating-the-networks/whos-my-network-operator>

³⁹ <https://www.nationalgrid.com/uk/electricity-transmission/network-and-infrastructure/network-route-maps>

There are no gas terminals within the Plan Area. The Plan Area is intersected by gas pipes⁴⁰.

Explanatory Text and anticipated future trends:

There are currently no gas terminals in the South East Region. There are areas of the South East Region within which gas pipelines and overhead power lines are present to facilitate supply. Without a strategic approach to development, it is less likely that development and new infrastructure is provided to complement the existing distribution of this infrastructure.

Other Material assets

Reported at Local level only

Reported at Local level only

Within the Plan Area the following assets have been identified:

- 6,189 no. Open access areas
- 3,396 no. Other sports facilities
- 9,239 no. Play Space
- 3,938 no. Playing Field
- 2,735 no. Public Park or Garden
- 5,070 no. Registered Common Land
- 3,848 no. Religious Grounds
- 2,318 no. Tennis Courts
- 4,638 no. National designated cycle routes

There are a number of railway tracks within the plan area connecting areas such as Swindon and Reading, Oxford and Banbury and Farnborough and Basingstoke. There are also many Major Roads within the Plan area, including M3, M25, M4, M40, M1, M25 and M11.

Explanatory Text and anticipated future trends:

⁴⁰ <https://www.nationalgrid.com/uk/gas-transmission/land-and-assets/network-route-maps>

As expected given the size of the Plan Area, it contains a wide range of material assets including recreational amenities, services, facilities and major infrastructure including road, rail, airports and ports, many of which concentrate or interact with the urban centres across the Plan Area.

Open Green Space

The NPPF⁴¹ puts the onus on local planning authorities to prepare an authority-wide, evidence-based greenspace strategy that includes an assessment of current greenspace provision. It also suggests LPAs use Local Green Space (LGS) as a designation to provide special protection against development for green areas of particular importance.

There are over 20,000 Open Green spaces within the South East region, with the main typologies as follows:

- Natural and Semi-natural Greenspace
- Outdoor Sports Facilities
- Parks and Gardens
- Amenity Greenspace
- Educational and Community Grounds

There are over 30,000 Open Green spaces within the Plan area with the main typologies reflecting the regional typologies:

- Natural and Semi-natural Greenspace
- Outdoor Sports Facilities
- Parks and Gardens
- Amenity Greenspace
- Educational and Community Grounds

Explanatory Text and anticipated future trends:

Open space, which includes all open space of public value, can take many forms, from formal sports pitches to open areas within a development, linear corridors and country parks. It can provide health and recreation benefits to people living and working nearby; have an ecological value and contribute to green infrastructure, as well as being an important part of the landscape and setting of built development, and an important component in the achievement of sustainable development⁴².

Local authorities play a vital role in⁴³:

- providing new, good quality greenspace that is inclusive and equitable
- improving, maintaining and protecting existing greenspace
- increasing green infrastructure within public spaces and promoting healthy streets
- improving transport links, pathways and other means of access to greenspace, and providing imaginative routes linking areas of greenspace for active travel

Without a co-ordinated strategic approach to development and infrastructure, there is increased potential for planning decisions to result in inappropriate development, which could fragment existing networks of open space thereby reducing connectivity.

Table 4 - Water Quality and Resources

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Water Framework Directive (WFD)	In England, the quality status of water bodies assessed under the WFD in 2020 were⁴⁴: Lakes: • High – 10% • Good – 22% • Moderate – 55% • Poor – 11% • Bad – 1% Rivers and Canals: • High – 3% • Good – 30% • Moderate – 49% • Poor – 16% • Bad – 3% Estuaries and Coastal: • High – 21% • Good – 55% • Moderate – 23% • Poor – 1% • Bad – 1%	In line with the WFD, River Basin Management Plans (RBMPs) are relevant for the South East Region and the status of waterbodies. Local government is involved in regulating, operating, influencing and undertaking projects in the river basin district (RBD) of the associated RBMP. The river basin districts which make up the South East region are Thames and the South East⁴⁵. As of 2015, the status of surface and groundwater water bodies in the RBDs are as follows: <i>Surface Waters (including lakes, coastal, estuarine and rivers, canals and surface water transfers) ecological status,</i> • Thames Water RBD totalling 498: - High – 0 - Good – 29 - Moderate – 320 - Poor – 112 - Bad – 27 • South East RBD totalling 282: - High – 0 - Good – 43	The Plan Areas falls within the Thames, South East, South West, Anglian and Severn River Basin. The Thames River Basin covers the largest proportion of the Plan Area. In addition to the information provided at regional level, as of 2015, the status of surface and groundwater water bodies in the South West, Anglian and Severn RBDs are as follows⁴⁶: <i>Surface Waters (including lakes, coastal, estuarine and rivers, canals and surface water transfers) ecological status,</i> • South West RBD totalling 697: - High – 2 - Good – 160 - Moderate – 420 - Poor – 94 - Bad – 21 • Anglian RBD totalling 603: - High – 0 - Good – 65 - Moderate – 419 - Poor – 106 - Bad – 13

⁴⁴ Joint Nature Conservation Committee (2021) *UK Biodiversity Indicators 2020 – B7. Surface water status*. Available: <https://hub.jncc.gov.uk/assets/b6dbbc22-235a-4664-8192-3a178d32ffde>

⁴⁵ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](https://www.wrsouth-east.co.uk/wp-content/uploads/2019/06/wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf)

⁴⁶ <https://www.gov.uk/government/publications/severn-river-basin-district-river-basin-management-plan>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
		- Moderate – 169 - Poor – 60 - Bad – 10 <i>Groundwaters (Chemical Status),</i> • Thames Water RBD totalling 47: - Good – 25 - Poor – 22 • South East RBD totalling 33: - Good – 17 - Poor – 16	• Severn RBD totalling 755: - High – 0 - Good – 151 - Moderate – 462 - Poor – 134 - Bad – 8 <i>Groundwaters (Chemical Status),</i> • South West RBD totalling 42: - Good – 20 - Poor – 22 • Anglian RBD totalling 31: - Good – 16 - Poor – 15 • Severn RBD totalling 42: - Good – 27 - Poor – 15 In respect of the DWMP, capacity issues for example will lead to increased risk of out of sewer flooding and overflows into receiving watercourses with consequent impacts on waterbody quality.
	Explanatory Text and anticipated future trends: The EU WFD is transposed into UK law through the following regulations: The Water Environment (WFD) (England and Wales) Regulations 2017 for England and Wales; the Water Environment and Water Services (Scotland) Act 2003 (WEWS Act) and The Water Environment (WFD) Regulations (Northern Ireland) 2003 for Northern Ireland. The purpose of the Directive is to establish a framework for the protection of inland surface waters (rivers and lakes), transitional waters (estuaries), coastal waters and groundwater. Groundwater is an important natural resource that supports river flows as well as ecological diversity in rivers, lakes and wetlands. It is also available for use, across the United Kingdom, for water supply by abstraction from boreholes, wells and springs.		

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	The number of waterbodies assessed each year varies and has decreased from 10,761 in 2009 to 9,301 in 2019. There was a small decrease in the overall number of water bodies awarded high or good surface water status between 2009 and 2018. In 2019, 36% of surface water bodies assessed under the WFD in the UK were in high or good status. This is the same as the 36% of surface water bodies assessed in 2009 and one percent higher than the 35% in 2014⁴⁷. RBMPs are prepared in line with the WFD to protect and improve the quality of our water environment. The RBMPs support the government's framework for the 25-year environment plan and will allow local communities to find more cost-effective ways to take action to further improve our water environment⁴⁸. As with most water bodies in England, there are a range of significant water management issues manifested in the South East and Thames Water RBDs, with pollution from towns, cities and transport noted as being an issue for 9% and 17% of water bodies in the respective RBD's. This includes Rainwater draining from roofs, roads and pavements carries pollutants, including grit, bacteria, oils, metals, vehicle emissions, detergent and road salt drains to surface water, including estuaries and coastal waters. Many homes and workplaces have 'misconnected' drains, meaning that dirty water often enters surface waters and groundwater rather than foul sewer drains. New development may result in physical modifications to water bodies – an issue affecting 43% of water bodies in the South East RBD and 44% in the Thames Water RBD. Without a coordinated approach to development and infrastructure there is increased potential for pollution to result at water bodies in the South East Region.		
Drinking Water Safeguard Zones Source Protection Areas	Drinking Water Safeguard Zones (DWSZs) are designated in England for any raw water sources that are 'at risk' of deterioration which would result in the need for additional treatment. These zones are areas where the land use is causing pollution of the raw water. Similarly, parts of the country at which there is increased risk of contamination to groundwater supplied from activities which might cause pollution are covered by Source Protection Zones (SPZs). The EA split SPZs into 3 main zones: inner (SPZ1), outer (SPZ2) and total catchment (SPZ3). A fourth zone (special interest) can sometimes also	32 DWSZ falls entirely or partially within the South East Region. There are several SPZs within the South East Region, predominately located across the centre and towards the south: SPZ 1 – 774 SPZ 1c – 117 SPZ 2 – 462 SPZ 2c – 114 SPZ 3 – 158 SPZ 3c – 1 SPZ 4 – 11	24 DWSZ falls entirely or partially within the plan area. There are several SPZs within the plan area, predominately located across the centre and towards the south: 1 – 453 1c – 43 2 – 272 2c – 40 3 – 81 3c – 1 4 – 5

⁴⁷ Joint Nature Conservation Committee (2020) *Surface Water Status – Datasheet*. Available: http://jncc.defra.gov.uk/docs/UKBI2015_DS_B7_Final2.xlsx

⁴⁸ DEFRA and Environment Agency (2019) *River basin management plans: 2015*. Available: <https://www.gov.uk/government/collections/river-basin-management-plans-2015>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	be applied (further detail provided in the explanatory text below).		
	Explanatory Text and anticipated future trends: DWSZs are designated by the Environment Agency for areas in which action is needed to address pollution so that extra treatment of raw water can be avoided. Furthermore, groundwater provides around a third of drinking water in England and maintains the flow in many of the waterbodies in the country. SPZs are also designated by the Environment Agency. These designations cover groundwater sources such as wells, boreholes and springs which are used for public drinking water supply. Groundwater supplies a third of our drinking water. In some areas of southern England, up to 80% of the water you get from your taps is from groundwater⁴⁹. Inner Zone (SPZ1) - This zone is 50 day travel time of pollutant to source with a 50 metres default minimum radius. Outer zone (SPZ2) - This zone is 400 day travel time of pollutant to source. This has a 250 or 500 metres minimum radius around the source depending on the amount of water taken. Total catchment (SPZ3) - This is the area around a supply source within which all the groundwater ends up at the abstraction point. This is the point from where the water is taken. This could extend some distance from the source point. Extended zones beneath protective cover (1c, 2c and 3c) - Areas where there is protective geology cover, such as clay. This is because activities below the surface, such as deep drilling, could create pathways for pollutants to enter the groundwater. Zone of special interest (SPZ4) - This zone is where local conditions require additional protection. Without a coordinated approach to development and infrastructure there is increased potential for pollution to occur in areas where there is a risk of contamination of drinking water resulting.		
Bathing Water Quality	As of 2019, in England, the quality status of bathing water areas assessed under the Bathing Waters Directive were⁵⁰: • Poor – 8; • Sufficient – 21; • Good – 92; • Excellent – 300; and • Closed – 1.	Not reported at this level – see Plan Area for further detail	There are approximately 10 designated bathing waters within the Plan Area. Eight of these designated bathing waters scored excellent, one good and one sufficient ⁵¹ .

⁴⁹ [Groundwater source protection zones \(SPZs\) - GOV.UK \(www.gov.uk\)](https://www.gov.uk/government/consultations/groundwater-source-protection-zones)

⁵⁰ Environment Agency, Bathing Water Data. Available: <http://environment.data.gov.uk/bwq/profiles/data.html?country=England>

⁵¹ <https://environment.data.gov.uk/bwq/profiles/>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	Classifications were not made for the 2020 season due to the impact of the COVID-19 pandemic on the sampling programme.		
	Explanatory Text and anticipated future trends: Water quality at designated bathing water sites in England is assessed by the Environment Agency. From May to September, weekly assessments measure current water quality, and at a number of sites daily pollution risk forecasts are issued. Annual ratings classify each site as excellent, good, sufficient or poor based on measurements taken over a period of up to four years ⁵² .		

Table 5 - Flood Risk

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Location of Flood Zones	The National Flood and Coastal Erosion Risk Management Strategy for England identifies that approximately 5.2 million, or one in six residential properties are located in areas at risk of flooding from rivers, the sea and surface water ⁵³ . Flood Zones 2 and 3 are located across the whole of England associated with river and coastal areas. Lowland areas are of particular risk as a consequence of floodplains being associated with the lower reaches of rivers ⁵⁴ .	The Thames river basin district has over 227,000 people at high risk of surface water flooding and over 107,000 people are at high risk of flooding from rivers and the sea. It contains two primary flood risk areas (FRAs), the London and Medway, which are areas with higher risk of surface water flooding. There is also one partial flood risk area, South Essex, which is partly within the Thames river basin district. The South East river basin district consists of one primary flood risk area, Brighton and Hove, and there are over 31,000 people at high risk of surface water flooding and over 36,000 people at high risk of flooding from rivers and the sea. There has been notable and severe flooding occurring across the	Flood Zones 2 and 3 are located across the Plan Area. There are a number of areas with flood defences in the Plan Area. These are predominately at coastal locations, but with a smaller number located inland. Examples of locations where flood defences are located are Selsey, London, Crawley and Guildford ⁵⁶ .

⁵² Environment Agency, Bathing Water Data. Available: <http://environment.data.gov.uk/bwq/profiles/data.html?country=England>

⁵³ Environment Agency (2009) *Flooding in England: A National Assessment of Flood Risk*. Available: https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/292928/geho0609bqds-e-e.pdf

⁵⁴ Environment Agency (2017) *Flood Map for Planning (Rivers and Sea)*. Available: <http://apps.environment-agency.gov.uk/wiyby/37837.aspx>

⁵⁶ <https://flood-map-for-planning.service.gov.uk/confirm-location?easting=532473&northing=181219&placeOrPostcode=London>

basin in recent years which resulted in significant impacts on communities, businesses and the natural environment⁵⁵.

Explanatory Text and anticipated future trends:

In England, the flood risk (river and tidal) is categorised into three zones⁵⁷ for planning purposes (noting that the NPPF further subdivides flood zone 3 into 3a and Functional Floodplain 3b (land where water has to flow or be stored in times of flood):

- Flood Zone 1 – Land unlikely to be affected by flooding, with a less than 0.1% (less than 1 in 1000) chance of flooding each year.
- Flood Zone 2 – Land likely to be affected by a major flood, with up to a 0.1% (1 in 1000) chance of occurring each year.
- Flood Zone 3 – Land likely to be affected by flooding from the sea by a flood that has a 0.5% (1 in 200) or greater chance of happening each year, or from a river by a flood that has a 1 per cent (1 in 100) or greater chance of happening each year.

The risk of surface water flooding also needs to be considered:

- Very low risk area (less than 0.1% (1:1000)) chance of flooding.
- Low risk area (0.1% to 1% (1:1000 – 1:100)) chance of flooding.
- Medium risk area (1% to 3.3% (1:100 – 1:30)) chance of flooding.
- High risk area (3.3% (1:30)) or greater chance of flooding.

Estimates of flood risk from different sources across the UK vary, but it is known that the level of risk is substantial – England has approximately 5.2million properties at risk⁵⁸

While new development is expected to occur in the plan area making use of a sequential approach, without a strategic approach, there is increased potential for the inappropriate siting of new development which may aggravate existing flood risk.

Table 6 - Soils, Geology and Land-use

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Agricultural Land Classifications	The Agricultural Land Classification system classifies land into five grades, with Grade 3 subdivided into Sub-grades 3a and 3b. The best and most versatile agricultural land is defined as Grades 1, 2 and 3a of the	The Agricultural Land Classification of the region is predominately of Grade 2, Grade 3 and Grade 4 with pockets of urban and non-agricultural land. There are some areas with Grade 1, particularly around the south and south east coast. The number of	The Agricultural Land Classification of the region is predominately Grade 3 land. There are notable areas of Grade 2 land towards the north east, with smaller areas throughout the Plan Area. Surrounding London is a large area of Urban land class, with smaller

⁵⁷ Environment Agency (2013) *Flood Map for Planning*. Available: <http://apps.environment-agency.gov.uk/wiyby/37837.aspx>

⁵⁸ https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/292928/geho0609bqds-e-e.pdf

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	Agricultural Land Classification (ALC) system. As of 2012 it is estimated that of the farmland in England, ⁵⁹ Grades 1 and 2 together form about 21% of soils. The subgrade 3a also covers about 21% of farmland in England.	allocated areas within each of the classifications are as follows:	pockets of throughout the Plan Area. There are also areas of Grade 1, Grade 4, Grade 5 and Non-Agricultural.
	Explanatory Text and anticipated future trends: ALC uses a grading system to assess and compare the quality of agricultural land at national, regional and local levels. It assesses the potential for land to support different agricultural uses, such as growing crops for food. It does not consider the land's current use and intensity of use. Natural England has a statutory role in advising local planning authorities about land quality issues. A combination of climate, site and soil characteristics and their unique interaction determines the limitation and grade of the land. These affect the: • range of crops that can be grown; • yield of crop; • consistency of yield; and • cost of producing the crop. When considering development proposals that affect agricultural land, developers and LPAs should aim to protect the best and most versatile (BMV) agricultural land and soils in England from significant, inappropriate or unsustainable development proposals. BMV agricultural land is graded 1 to 3a. The highest grade goes to land that⁶⁰: • gives the highest yield or output; • has the widest range and versatility of use; • produces the most consistent yield from a narrower range of crops; and • requires less input. There is increased potential for development to occur in areas which would affect higher value agricultural land without a co-ordinated strategic approach to development and infrastructure in the region.		
Geological SSSIs and RIGS	There are over 4,100 SSSIs in England, covering about 1,099,505 ha ⁶¹ . Of the total	Around 1189 Sites of Special Scientific Interest can be found in the South East	There are 778 classified SSSI's within the Plan Area.

⁵⁹ Natural England (2012) *Agricultural Land Classification: protecting the best and most versatile agricultural land (TIN049)*. Available: <http://publications.naturalengland.org.uk/publication/35012>

⁶⁰ Natural England (2018) *Guide to assessing development proposals on agricultural land*. Available: <https://www.gov.uk/government/publications/agricultural-land-assess-proposals-for-development/guide-to-assessing-development-proposals-on-agricultural-land>

⁶¹ Natural England (2016) *Designated Sites View*. Available: <https://designatedsites.naturalengland.org.uk/>.

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	area covered 90.4% are in favourable or unfavourable recovering condition⁶². As of June 2011, there were more than 1,200 SSSIs notified for geological interest in England and 300 in Wales. At that time, 72% of geological features were judged to be in favourable condition⁶³.	region, this includes sites designated for both biological and geological reasons.	A number of these are designated as Geological SSSI's including Auclaye and Clock House Brickworks SSSI's⁶⁴.
	Explanatory Text and anticipated future trends: SSSIs represent the principal national designation for places of importance for biodiversity and geodiversity in the UK. The designation of areas as SSSIs attaches certain legal requirements to the management of these sites. In addition to designating areas as SSSIs when the land's wildlife is of special interest, Natural England will select and notify an area as a new SSSI when it believes the geology or landform is of special interest⁶⁵. At a national level the majority of SSSIs are in favourable or unfavourable recovering condition. In the South East Region the majority of SSSIs in favourable or unfavourable recovering condition. However, 9.3% of sites contain units that are in unfavourable condition which are reported to have not improved or are in decline from when previously reported on⁶⁶. Geology in the South East is likely to face threats from development; human activities such as pollution, roads, disturbance, farming practices; loss of habitat; loss of food sources and a changing climate. Without a co-ordinated strategic approach to development and infrastructure is likely to increase the potential for inappropriate greenfield development to occur which could increase pressures on SSSIs designated for their geological importance.		
Contaminated Land	As of 2020⁶⁷, there are 54 special sites of contaminated land in England. These are sites that due to specific land uses, past activities or water pollution are passed from the local council to the Environment Agency to regulate. The National Planning Policy Framework places the onus with the developer and/or	Reporting/mapping is not freely available at this level however EA Special Sites are present within the South East Region. There are also anticipated to be a large number of brownfield sites. Such sites are likely to present a potential risk in respect of contaminated land.	There are approximately 3,700 historic landfill sites and approximately 330 authorised landfill sites within the Plan Area.

⁶⁷ Environment Agency (2020) *Contaminated Land Special Sites*. Available: <https://data.gov.uk/dataset/e3770885-fc05-4813-9e60-42b03ec411cf/contaminated-land-special-sites>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	landowner for securing a safe land/development.		
	Explanatory Text and anticipated future trends: Land is legally defined as 'contaminated land' where substances are causing or could cause: • Significant harm to people, property or protected species; • Significant pollution of surface waters (for example lakes and rivers) or groundwater; and • Harm to people as a result of radioactivity. Land may be contaminated by various substances including: • Heavy metals such as arsenic, cadmium and lead; • Oils and tars; • Chemical substances and preparations, like solvents; • Gases; • Asbestos; and • Radioactive substances. Some types of contaminated land are classed as 'special sites', which are then regulated by the Environment Agency in England once a local council has decided that an area is a special site⁶⁸. The National Planning Policy Framework requires a risk assessment of land potentially affected by contamination and expects all investigations to be undertaken in accordance with established practices such as BS10175 (2002) 'Code of Practice for the Investigation of Potentially Contaminated Sites'.		

Table 7 - Air Quality

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Air Quality Management Areas	As of September 2020, there were 532 AQMAs in England ⁶⁹ . AQMAs are distributed throughout England, although they are principally located in areas of high	There is approximately 118 AQMAs declared within the South East Region. A high proportion of the local authorities which fall within the South East region	There is approximately 83 AQMAs declared within the plan area.

⁶⁸ Environment Agency (2020) *Contaminated land*. Available at: <https://www.gov.uk/contaminated-land>

⁶⁹ Department for Environment and Rural Affairs (2016) *AQMAs interactive map*. Available: <https://uk-air.defra.gov.uk/aqma/maps>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	population. The largest AQMAs are within major cities, including London, Birmingham, Manchester, Liverpool, Sheffield and Bristol. A significant amount of AQMAs are designated along major trunk roads and are generally associated with areas of high congestion.	contain at least one AQMA and are predominately designated for Nitrogen dioxide (NO ₂) and Particulate Matter (PM ₁₀) ⁷⁰ .	
Explanatory Text and anticipated future trends: Since December 1997 each local authority in the UK must review and assess air quality in their area to determine performance against national air quality objectives. Where air quality objectives are not likely to be achieved an AQMA must be declared. AQMAs are typically associated with vehicle emissions, principally oxides of nitrogen (NO_x), oxides of sulphur (SO₂) and particulates (PM₁₀). As such, AQMAs are predominantly associated with urban areas and the road network⁷¹. The quality of our air in the UK has improved considerably over the last decade. Road transport is a key source of many air pollutants, particularly in urban areas. There are two main trends in the transport sector working in opposite directions: new vehicles are becoming individually cleaner in response to European emission standards legislation, but total vehicle kilometres are increasing. Overall emissions of key air pollutants from road transport have fallen by about 50% over the last decade, despite increases in traffic, and are expected to reduce by a further 25% over the next decade. This is mainly a result of progressively tighter vehicle emission and fuel standards agreed at European level and set in UK regulations⁷². 118 AQMAs have been declared in the South East region. Note that there is also increasing recognition of the role solid fuel use in domestic properties plays in poor air quality, with wood burning making a significant contribution toward wintertime PM₁₀ concentrations in many towns and cities. PM₁₀ attributable to wood burning tends to peak during wintertime evenings and weekends. This suggests that wood is used principally as a secondary or 'lifestyle' fuel, rather than a primary source of heating. It also suggests that the majority of current air quality impacts are linked to simpler appliances such as open fires and stoves, rather than more complex appliances such as biomass boilers and Combined Heat and Power systems. Local authorities have experienced a number of gross pollution and nuisance cases linked to solid fuel appliances, and the frequency of these cases may be increasing. In many cases these problems occur when appliances are poorly installed, misused and/or inappropriate fuels are used⁷³.			

⁷⁰ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](https://www.wrsouth-east.co.uk/wp-content/uploads/2013/07/wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf)

⁷² Department for Environment and Rural Affairs (2011) *The Air Quality Strategy for England, Scotland, Wales and Northern Ireland - Volume 1*. Available: <https://www.gov.uk/government/publications/the-air-quality-strategy-for-england-scotland-wales-and-northern-ireland-volume-1>

⁷³ Solid Fuel and Air Quality: An update for Local Authorities, 2013 <https://www.environmental-protection.org.uk/wp-content/uploads/2013/07/Solid-Fuel-and-Air-Quality-Update-for-LAs-final-060413.pdf>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Noise Action Important Areas	In England, it has been estimated that the number of people immediately associated with the Important Areas (noise 'hotspots') identified for the major roads outside agglomerations* is around 57,000⁷⁴. It has been estimated that the number of people immediately associated with the Important Areas (noise 'hotspots') identified for the major railways outside agglomerations is around 5,000⁷⁵. It has been estimated that the approximate number of people immediately associated with the Important Areas identified for the 65 agglomerations, with respect to road and rail noise, is around 130,000 and 13,000 respectively⁷⁶. Within the 65 agglomerations identified in DEFRA's Noise Action Plan 2019, DEFRA notes that, with respect to road and rail noise, there are around 130,000 and 13,000 people directly associated with Important Areas⁷⁷.	There are approximately 2,473 Noise Action Important Areas within the South East Region of England.	Approximately 3,126 Noise Action Important Areas have been identified within the plan area. The source of noise in these areas is predominately roads, with the exception a small number in which the source is rail.
Explanatory Text and anticipated future trends: Noise Action Plans are required by the Environmental Noise Directive. Noise Important Areas identify 'hotspot' locations where the highest 1% of noise levels at residential locations can be found and therefore highlight where further investigation should be directed. *DEFRA defines an agglomeration as an area having a population in excess of 100,000 persons and a population density equal to or greater than 500 people per km2 and which is considered to be urbanised.

Table 8 - Climate Change

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Climate Change Distribution of GHG emissions	As of 2019⁷⁸, greenhouse gas (GHG) emissions for the UK totalled 455 MtCO₂e, of this 365 MtCO₂e was CO₂ emissions. This was a reduction of 40% compared to the figures recorded for 1990. <i>Please note more recent datasets are not currently available.</i>	Based on the local authorities which fall within the South East region, the total carbon dioxide (CO₂) emissions for 2018 across all sectors is estimated at 95,371 kilo tonnes (ktCO₂) (not including Land use, land-use change, and forestry (LULUCF))⁷⁹.	Climate change trends within the Plan Area are anticipated to be in keeping with that in the wider South East and National level.
Explanatory Text and anticipated future trends: The UK's yearly publication⁸⁰ on GHG emissions provides the latest estimates of 1990-2019 UK territorial greenhouse gas emissions, which are presented in carbon dioxide equivalent units (CO₂e). They show greenhouse gas emissions occurring within the UK's borders and cover the Kyoto "basket" of seven greenhouse gases: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), sulphur hexafluoride (SF₆) and nitrogen trifluoride (NF₃). The UK has domestic targets for reducing greenhouse gas emissions under the Climate Change Act 2008 (CCA). The CCA established a long-term legally binding framework to reduce emissions, initially committing the UK to reducing emissions by at least 80% below 1990/95 baselines by 2050. In June 2019, following the IPCC's Special Report on Global Warming of 1.5°C and advice from the independent Committee on Climate Change, the CCA was amended to commit the UK to achieving a 100% reduction in emissions (to net zero) by 2050. The CCA also introduced carbon budgets, which set legally binding limits on the total amount of greenhouse gas emissions the UK can emit for a given five-year period. The first carbon budget ran from 2008-12. In 2014, the UK confirmed that it had met the budget, with emissions 36 MtCO₂e below the cap of 3,018 MtCO₂e. The second carbon budget ran from 2013-17. In 2019, the UK confirmed that it had met the budget, with emissions 384 MtCO₂e below the cap of 2,782 MtCO₂e. <u>Anticipated Future Trends:</u> Recent trends illustrate that GHG emissions are primarily being reduced in the energy sector due to the change in fuel mix for electricity generation, in particular a reduction in the use of coal and gas. It is expected that this will continue over the next few years and decades in			

⁷⁸ Department for Business, Energy & Industrial Strategy (2021) *2019 UK GHG Emissions, Final Figures*. Available: https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/957887/2019_Final_greenhouse_gas_emissions_statistical_release.pdf

⁷⁹ Water Resources South East Scoping Report [wrsr-regional-plan-strategic-environmental-assessment-scoping-report.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/862887/2018_Final_greenhouse_gas_emissions_statistical_release.pdf)

⁸⁰ Department for Business, Energy & Industrial Strategy (2020) *2018 UK GHG Emissions, Final Figures*. Available: https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/862887/2018_Final_greenhouse_gas_emissions_statistical_release.pdf

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	favour of more renewable and low-carbon sources. It can also be expected that GHG emissions in the transportation sector are likely to decrease with the increasing availability and feasibility of electric vehicles and business fleets.		
Climate Change Contribution of sectors to GHG emissions	As of 2019, Transport was the largest emitting sector of UK GHG emissions in 2019, with 27%, followed by the Energy Supply sector at 23%. The remaining sectors contributed to UK GHG emissions as follows: Business (17%), Residential (15%), Agriculture (10%), and Other (10%). The Energy supply sector delivered the largest reduction in emissions from 2018 to 2019, with an 8% reduction.	The transport sector contributed the highest proportion of emissions to the total in 2018 at 40% followed by the domestic and industrial sector at 31% and 29% respectively. The LULUCF sector is estimated to be responsible for the removal of 2,406ktCO₂ equating to a 3% reduction in the total CO₂ emissions⁸¹.	Climate change trends within the Plan Area are anticipated to be in keeping with that in the wider South East and National level.
Explanatory Text and anticipated future trends: The UK's yearly publication⁸² on GHG emissions provides the latest estimates of 1990-2019 UK territorial greenhouse gas emissions, which are presented in carbon dioxide equivalent units (CO₂e). They show greenhouse gas emissions occurring within the UK's borders and cover the Kyoto "basket" of seven greenhouse gases: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), sulphur hexafluoride (SF₆) and nitrogen trifluoride (NF₃). The UK has domestic targets for reducing greenhouse gas emissions under the Climate Change Act 2008 (CCA). The CCA established a long-term legally binding framework to reduce emissions, initially committing the UK to reducing emissions by at least 80% below 1990/95 baselines by 2050. In June 2019, following the IPCC's Special Report on Global Warming of 1.5°C and advice from the independent Committee on Climate Change, the CCA was amended to commit the UK to achieving a 100% reduction in emissions (to net zero) by 2050. The CCA also introduced carbon budgets, which set legally binding limits on the total amount of greenhouse gas emissions the UK can emit for a given five-year period. The first carbon budget ran from 2008-12. In 2014, the UK confirmed that it had met the budget, with emissions 36 MtCO₂e below the cap of 3,018 MtCO₂e. The second carbon budget ran from 2013-17. In 2019, the UK confirmed that it had met the budget, with emissions 384 MtCO₂e below the cap of 2,782 MtCO₂e. The UK has so far outperformed its budgets. But progress is slowing, and the country is not on track to meet its future budgets or the overall reduction target, according to the 2021 Progress Report to Parliament by the Committee on Climate Change. UK five-year carbon budgets

6th carbon budget (2033 to 2037)	965																
Climate Change Predicted changes to temperature and weather patterns	As of November 2018⁸³, the following climate change impacts are predicted for England: - More frequent hotter, drier summers; - More frequent milder, wetter winters; - Rising sea levels; and - More extreme weather events, such as flooding and drought. In the last decade sea levels around the UK rose on average by over 3mm a year.	The projected changes in temperature and precipitation for the south east of England by the 2050s (2040-2069), under the RCP8.5 scenario (high emissions scenario) are as follows; • Annual mean temperatures are projected to increase by 2.0°C. Summer temperatures are projected to see the largest increase by 2.6°C and winter temperatures by 1.7°C	The projected changes in temperature and precipitation by the 2050s are anticipated to be in line with that reported at a Regional level.														

⁸³ Environment Agency (2018) *Climate Change Impacts and Adaptation*. Available: https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/758983/Climate_change_impacts_and_adaptation.pdf

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
		Annual mean precipitation is projected to decrease by 1.1%. Seasonal variability is projected with a 22.9% decrease in precipitation during summer months and an increase of 11.5% during winter months.	
Explanatory Text and anticipated future trends: In December 2015, climate change issues were highlighted during the UN Conference of the Parties (COP) 21. At COP21, 189 parties ratified The Paris Agreement. The Paris Agreement's long-term temperature goal is to keep the increase in global average temperature to well below 2 °C above pre-industrial levels; and to pursue efforts to limit the increase to 1.5 °C, recognising that this would substantially reduce the risks and impacts of climate change globally. It also aims to increase the ability of parties to adapt to the adverse impacts of climate change and make "finance flows consistent with a pathway towards low greenhouse gas emissions and climate-resilient development." Under the Paris Agreement, each country must determine, plan, and regularly report on the contribution that it undertakes to mitigate global warming. No mechanism forces a country to set a specific emissions target by a specific date, but each target should go beyond previously set targets.			

Table 9 - Historic Environment

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
World Heritage Sites	There are 17 World Heritage Sites in England⁸⁴ with 31 distributed across the entirety of the United Kingdom. The sites in England are: - Blenheim Palace - Canterbury Cathedral, St Augustine's Abbey, and St Martin's Church	There are 8 World Heritage Sites in the South East Region: - Blenheim Palace - Tower of London - Canterbury Cathedral, St. Augustine's Abbey and St. Martin's Church - Palace of Westminster, Westminster Abbey and St. Margaret's Church	There are 6 World Heritage Sites within the plan area: - Blenheim Palace - Tower of London - Palace of Westminster, Westminster Abbey and St. Margaret's Church - Maritime Greenwich

⁸⁴ UNESCO (2017) *World Heritage Convention - United Kingdom of Great Britain and Northern Ireland*. Available: <http://whc.unesco.org/en/statesparties/gb>

• City of Bath • Cornwall and West Devon Mining Landscape • Derwent Valley Mills • Dorset and East Devon Coast • Durham Castle and Cathedral • Frontiers of the Roman Empire • Ironbridge Gorge • Lake District • Maritime Greenwich • Palace of Westminster and Westminster Abbey, including Saint Margaret's Church • Royal Botanic Gardens, Kew • Saltaire • Stonehenge, Avebury and Associated Sites • Studley Royal Park including the Ruins of Fountains Abbey • Tower of London To be included on the World Heritage List, sites must be of "Outstanding Universal Value". This is demonstrated by meeting one of the ten selection criteria. These criteria are divided between those of cultural and natural importance. Within England the majority of sites (17) have been notified for their cultural value, with only one site (Dorset and East Devon Coast) notified for its natural value⁸⁵.	• Maritime Greenwich • Stonehenge, Avebury and Associated Sites • Royal Botanic Gardens, Kew • City of Bath	• Stonehenge, Avebury and Associated Sites • Royal Botanic Gardens, Kew
Explanatory Text and anticipated future trends:		

⁸⁵ UNESCO (2020) *About World Heritage: United Kingdom of Great Britain and Northern Ireland*. Available: <https://whc.unesco.org/en/statesparties/gb>

World Heritage Sites are designated to meet the UK's commitments under the World Heritage Convention and the sites are designated for their globally important cultural or natural interest and require appropriate management and protection measures⁸⁶.

The first World Heritage Sites within the UK were designated in 1986. Sites can continue to be nominated, with the last site on the UK mainland being the Forth Rail Bridge, designated in 2015⁸⁷. Sites are inscribed by the United Nations Educational, Scientific and Cultural Organisation (UNESCO). In England the Department for (DCMS) acts as the UK 'State Party' which is responsible for nominating new sites. The DCMS receives advice from Historic England in this regard⁸⁸. The Outstanding Universal Value of a World Heritage Site indicates its importance as a heritage asset of the highest significance. This is to be taken into account by the relevant authorities in plan-making and determining planning applications⁸⁹.

Of the sites in England, none have been placed on the List of World Heritage in Danger. The list presently comprises 52 sites in total worldwide. These are sites at which conditions are present to threaten the characteristics for which a site was placed on the World Heritage List⁹⁰.

Development associated with the DWMP in the South East Region may be inappropriately located or designated to pose a risk to the World Heritage Sites and as well as their settings. Without a co-ordinated strategic approach to development and infrastructure there is an increased potential for this risk to result.

Scheduled Monuments	As of 2020, there are almost 20,000 Scheduled Monuments located throughout England⁹¹. The criteria for determining whether Scheduled Monuments are of national importance are guided by the Principles of Selection laid down by the Secretary of State for Digital, Culture, Media and Sport, covering the basic characteristics of monuments⁹². They are: • Period	There are 5,207 Scheduled Monuments in the South East Region.	There are 3,445 scheduled monuments in the Plan Area.

Explanatory Text and anticipated future trends:

Scheduling is the selection of nationally important archaeological sites which are legally protected. The monitoring and identification of sites is undertaken by Historic England. Scheduled Monuments cover the whole range of archaeological sites and are not always visible or above ground sites.

The condition of Scheduled Monuments is monitored as part of Historic England's 'Heritage at Risk' programme. Local government archaeological services, plus independent national and local heritage organisations and community groups, can also play important roles in their curation, plus that of non-scheduled but nationally important monuments⁹³.

Additional housing development in the South East Region may be **inappropriately located or designated to pose a risk to scheduled monuments and their settings**. Without a co-ordinated strategic approach to development and infrastructure there is an increased potential for this risk to result.

Listed Buildings and Conservation Areas	As noted by Historic England⁹⁴, the total number of listed buildings is unknown, but is estimated to be around 500,000 in England. Conservation Areas are designated for their special architectural and historic interest and were first designated in 1967 with over 10,000 in England as of 2021⁹⁵.	There are 118,344 listed buildings in the South East Region, these are graded as follows: - Grade I – 2,859 - Grade II – 108,709 - Grade II* – 6,776 There are approximately 3,330 Conservation Areas in the South East Region.	There are 79,205 listed buildings in the Plan Area, which are graded as follows: - Grade I – 1,956 - Grade II – 72,631 - Grade II* – 4,618 The Plan Area has approximately 2,430 Conservation Areas within or intersecting the boundary.

Explanatory Text and anticipated future trends:

⁹³ Department for Culture, Media and Sport (2013)

https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/249695/SM_policy_statement_10-2013_2.pdf

⁹⁴ Historic England (2020) *Listed Buildings*. Available: <https://historicengland.org.uk/listing/what-is-designation/listed-buildings/>

⁹⁵ Historic England (2020) *Conservation Areas*. Available: <https://historicengland.org.uk/listing/what-is-designation/local/conservation-areas/>

Listing of buildings is concerned with recognising the buildings special architectural and historic interest, with a view to protecting the building, under the planning system for future generations to enjoy. All buildings built before 1700 which survive in anything like their original condition are listed, as are most of those built between 1700 and 1840. Particularly careful selection is required for buildings from the period after 1945. Usually a building has to be over 30 years old to be eligible for listing⁹⁶.

Buildings are considered by the Secretary of State (for Digital, Culture, Media and Sport) and where they are deemed to be of special architectural or historic interest they can be included on the list. The Planning (Listed Buildings and Conservation Areas) Act 1990 sets out the designation regime⁹⁷.

There are three categories of listed building:

- Grade I buildings are of exceptional interest, only 2.5% of listed buildings are Grade I
- Grade II* buildings are particularly important buildings of more than special interest; 5.8% of listed buildings are Grade II*
- Grade II buildings are of special interest; 91.7% of all listed buildings are in this class and it is the most likely grade of listing for a homeowner.

Local authorities have a positive legal duty to designate conservation areas where parts of their own area are of special architectural or historic interest. In exceptional circumstances, where the local authority has not done so, the Secretary of State (for Digital, Culture, Media and Sport) may designate a conservation area anywhere in England. The Planning (Listed Buildings and Conservation Areas) Act 1990 also sets out the requirement for local authority's proposals for the preservation and enhancement of conservation areas.

Additional development in the South East Region may be inappropriately located or designed to pose a risk to listed building and conservation areas and their settings. Without a co-ordinated strategic approach to development and infrastructure there is an increased potential for this risk to result.

Historic Battlefields	As of 2021, there are 47 Historic Battlefields in England⁹⁸. Of these, three battlefields are on the Heritage at Risk Register⁹⁹. The purpose of the Register of Historic Battlefields in England is to provide protection through the planning system and to promote a better understanding of the significance and public enjoyment of these sites. If the site of a battle is to merit	The South East region contains 17 Registered Battlefields: • Battle of Barnet 1471 • Battle of Chalgrove 1643 • Battle of Cheriton 1644 • Battle of Cropredy Bridge 1644 • Battle of Edgehill 1642 • Battle of Evesham 1265	There are 9 Historic Battlefields in the Plan Area: • Battle of Barnet 1471 • Battle of Chalgrove 1643 • Battle of Cropredy Bridge 1644 • Battle of Edgehill 1642 • Battle of Naseby 1645 • Battle of Newbury 1643

- Battle of Edgcote 1469

- Battle of Roundway Down 1643
- Battle of Stow (-on-the-Wold) 1646
- Battle of Edgcote 1469

Explanatory Text and anticipated future trends:

Historic battlefields are designated by Historic England as conferred under the Historic Buildings and Ancient Monuments Act, 1983 (as amended).

Parks and Gardens

As of 2020, there are 1,670 Registered Historic Parks and Gardens within England¹⁰⁰, which represents an increase of 64 since 2010 (see Historic England heritage indicators 2020).

There are 103 registered parks and gardens on the Heritage at Risk (HAR) Register, representing 6.2% of the total number of registered parks and gardens in England¹⁰¹

There are 786 Registered Parks and Gardens within the South East Region. These are graded as follows;

- Grade I – 84
- Grade II - 487
- Grade II* – 215

There are 582 registered Historic Parks and Gardens in the Plan Area:

- Grade I – 73
- Grade II - 362
- Grade II* – 147

Explanatory Text and anticipated future trends:

The purpose of Registers of Historic Parks and Gardens in England is to encourage the protection of gardens, grounds and other open spaces which are of historic importance. The majority of sites registered are, or started life as, the grounds of private houses, but public parks and cemeteries form important categories too.

¹⁰⁰ Historic England (2020) *Heritage Indicators 2020*. Available: <https://historicengland.org.uk/content/heritage-counts/pub/2020/heritage-indicators-2020/>

¹⁰¹ Historic England (2021) *Registered Parks and Gardens at Risk*. Available: <https://historicengland.org.uk/advice/heritage-at-risk/landscapes/registered-parks-and-gardens-at-risk/>

The emphasis of the Register is on 'designed' landscapes, rather than on planting or botanical importance. The various types of designed landscape included on the Register are designated in the following four themes:

- Rural Landscapes
- Urban Landscapes
- Landscapes of Remembrance
- Institutional Landscapes

There are also numerous unregistered parks and gardens within the plan area. Whilst they are non-statutory designations, they remain relevant considerations for local planning and developments.

The plan area contains numerous heritage assets some of which are on Historic England's Heritage at Risk Register. This includes a small number of Registered Parks and Gardens. New development within the plan area may result in pressure on areas of importance for their cultural heritage and aesthetic quality and there is a requirement for them to be preserved and enhanced.

Protected Wrecks	There are 54 Protected Wrecks within England.	One Protected Wreck has been identified within the South East Region. It is called 'Grace Dieu and the possible site of the Holigost'.	No Protected Wrecks have been identified within the Plan Area.
	The Protection of Wrecks Act (1973) allows the Government to designate a wreck to prevent uncontrolled interference. Designated sites are identified as being likely to contain the remains of a vessel, or its contents, which are of historical, artistic, or archaeological importance ¹⁰² .		

Table 10 - Landscape

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
National Parks	There are 10 National Parks in England¹⁰³: • Broads • Dartmoor • Exmoor • Lake District • New Forest • Northumberland • North York Moors • Peak District	New Forest and South Downs National Parks are within the South East Region. New Forest became designated in 2005 and South Downs in 2010. New Forest National Park covers an area of 566km² and is made up of ancient woodland, open heathlands and coastline.	Similarly to the South East, the Plan Area is intersected by the New Forest and South Downs National Parks.

¹⁰² Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](#)

¹⁰³ National Parks (2016) *National Parks – Britain's Breathing Space*. Available: <http://www.nationalparks.gov.uk/quick-guide-to-the-uks-national-parks>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	• South Downs • Yorkshire Dales	South Downs National Park is designated for its rolling hills, picturesque towns and villages, and dramatic cliffs ¹⁰⁴ .	
	Explanatory Text and anticipated future trends: In England and Wales, the purpose of National Parks is to conserve and enhance landscapes within the countryside whilst promoting public enjoyment of them and having regard for the social and economic well-being of those living within them. The National Parks and Access to the Countryside Act 1949 established the National Park designation in England and Wales. In addition, the Environment Act 1995 requires relevant authorities to have regard for nature conservation. The designation of National Parks is an ongoing process with two being added in England since 2008 (South Downs and Broads).		
Areas of Outstanding Natural Beauty	There are 34 AONBs located within England¹⁰⁵: • Arnside & Silverdale • Blackdown Hills • Cannock Chase • Chichester Harbour • Chilterns • Cornwall • Cotswolds • Cranborne Chase and West Wiltshire Downs • Dedham Vale • Dorset • East Devon • Forest of Bowland • Howardian Hills • High Weald • Isle of Wight • Isles of Scilly • Kent Downs	There are nine AONB within the South East region: • Kent Downs • High Weald • Surrey Hills • Chichester Harbour • Isle of Wight • Chilterns • North Wessex Downs • Cotswolds • Cranborne Chase and West Wiltshire Downs	There are 8 AONB within the Plan Area as follows: • Chichester Harbour • Chilterns • Cotswolds • Cranborne Chase and West Wiltshire Downs • High Weald • Kent Downs • North Wessex Downs • Surrey Hills

¹⁰⁴ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](#)

¹⁰⁵ The National Association of Areas of Outstanding Natural Beauty (2017) *Areas of Outstanding Natural Beauty*. Available: <http://www.landscapesforlife.org.uk/>

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	- Lincolnshire Wolds - Malvern Hills - Mendip Hills - Norfolk Coast - North Devon - North Pennines - North Wessex Downs - Nidderdale - Northumberland Coast - Quantock Hills - Shropshire Hills - Solway Coast - South Devon - Suffolk Coast and Heaths - Surrey Hills - Tamar Valley - Wye Valley (England and Wales)¹⁰⁶		
Explanatory Text and anticipated future trends: In England, the primary purpose of the AONB designation is to conserve natural beauty – which by statute includes wildlife, physiographic features and cultural heritage as well as the more conventional concepts of landscape and scenery. Account is taken of the need to safeguard agriculture, forestry and other rural industries and the economic and social needs of local communities. Particular regard should be paid to promoting sustainable forms of social and economic development, that in themselves conserve and enhance the environment. These areas have equivalent status to National Parks as far as conservation is concerned. AONBs are designated under the National Parks and Access to the Countryside Act 1949, amended in the Environment Act 1995. The Countryside and Rights of Way Act 2000 clarifies the procedure and purpose of designating AONBs. There is a need to protect landscape character (including that of the AONBs) from potential threats. This includes issues such as inappropriate development, lack of appropriate management and climate change. Without a co-ordinated strategic approach to development and infrastructure degradation of the special qualities of the AONBs within the region is more likely to result.			

¹⁰⁶ The Wye Valley takes in land within both England and Wales.

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
Landscape Character Areas	Natural England has produced National Character Area (NCAs) Profiles ¹⁰⁷ which divide England into 159 distinct natural areas. Each is defined by a unique combination of landscape, biodiversity, geodiversity, history, and cultural and economic activity. Their boundaries follow natural lines in the landscape rather than administrative boundaries. They can be used for planning and development.	There are 40 NCAs within the South East Region.	There are 34 NCAs within the plan area
Explanatory Text and anticipated future trends: Landscape Character Areas or Landscape Character Assessments encompass various aspects of landscape, biodiversity, heritage, cultural and geological features. These are non-statutory and used as an aid in the planning process and for decision making. Each LCA profile produced by Natural England includes a description of the natural and cultural features that shape our landscapes, how the landscape has changed over time, the current key drivers for ongoing change, and a broad analysis of each area's characteristics and ecosystem services. Statements of Environmental Opportunity (SEOs) are suggested, which draw on this integrated information. The SEOs offer guidance on the critical issues, which could help to achieve sustainable growth and a more secure environmental future. There is a need to protect landscape character from potential threats. This includes issues such as inappropriate development, lack of appropriate management and climate change. Without a co-ordinated strategic approach to development and infrastructure degradation of the special qualities of the AONBs within the region is more likely to result.			
Green Belt	As of 2021 the extent of land designated as Green Belt in England was estimated at 1,614,000 hectares, around 12.4% of the land area of England ¹⁰⁸ . Land designated as Green Belt in England is distributed around the following 16 urban cores (listed by largest area to smallest area): London;	Within the South East Region there is over 80 areas designated as Green Belts. The Green Belt around London is an important aspect of the South East region landscape which exists to prevent urban sprawl ¹⁰⁹ .	There are 65 areas designated as Green Belts within the plan area.

¹⁰⁷ Natural England (2014) *National Character Area profiles: data for local decision making*. Available: <https://www.gov.uk/government/publications/national-character-area-profiles-data-for-local-decision-making>

¹⁰⁸ MHCLG (2020) *Local Authority Green Belt: England 2020-21*. Available: https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/1020886/Green_Belt_statistics_for_England_2020-21_-_Factsheet.pdf

¹⁰⁹ Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](https://www.wrsouth-east.co.uk/wp-content/uploads/2021/06/wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf)

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	- Merseyside and Greater Manchester; - South and West Yorkshire; - Birmingham; - Tyne and Wear; - Bath and Bristol; - Derby and Nottingham; - Stoke-on-Trent; - Bournemouth, Christchurch and Poole; - Oxford; - York; - Cambridge; - Cheltenham and Gloucester; - Blackpool; - Camforth, Lancaster and Morecambe; and - Burton-upon-Trent and Swadlincote.		
Explanatory Text and anticipated future trends: The National Planning Policy Framework attaches great importance to Green Belts. The fundamental aim of Green Belt policy is to prevent urban sprawl by keeping land permanently open; the essential characteristics of Green Belts are their openness and their permanence¹¹⁰. In 2021, 180 out of 314 local authorities have some land designated as Green Belt. Green Belt serves five purposes: - to check the unrestricted sprawl of large built-up areas; - to prevent neighbouring towns merging into one another; - to assist in safeguarding the countryside from encroachment; - to preserve the setting and special character of historic towns; and - to assist in urban regeneration, by encouraging the recycling of derelict and other urban land.			

¹¹⁰ MHCLG (2020) *Local Authority Green Belt: England 2019-20*. Available:

https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/916232/England_Green_Belt_Statistics_2019-20.pdf

	National (UK & England)	Regional (South East Region)	Local (Plan Area)
	Once Green Belts have been defined, local planning authorities should plan positively to enhance their beneficial use, such as looking for opportunities to provide access; to provide opportunities for outdoor sport and recreation; to retain and enhance landscapes, visual amenity and biodiversity; or to improve damaged and derelict land. Across England between March 2020 and March 2021 there was a decrease of 3,220 hectares (0.1%) in the area of land designated as Green Belt. In spite of its strong protection through national planning policy Green Belt may come under pressure as areas are targeted for potential release and development in inappropriate locations as housing needs increase. There is increased potential for Green Belt land that has not been identified as suitable for strategic growth to be subject to development without a co-ordinated strategic planning approach.		
Woodland Priority Habitat	As of October 2021, 39% of total priority habitats in England are classified as deciduous woodland ¹¹¹ . The majority of woodland priority habitats are located in the South East of England.	Priority habitats make up 16.6% of the South East region equating to a total of 39,5109ha. Deciduous woodland accounts for the highest percentage of priority habitat in the region ¹¹² .	Priority habitat within the Plan Area is anticipated to be in keeping with that reported at the regional and national level.
	Explanatory Text and anticipated future trends: Priority habitats can be designated as protected areas called Sites of Special Scientific Interest (SSSIs). They can also be outside of these SSSI protected areas but be under Higher Level Stewardship (HLS) or Countryside Stewardship (CS) agreements or fall within Forestry Commission (FC) 'Managed woodland'. Some priority habitats, however, fall outside of the protection of all these schemes. <u>Anticipated Future Trends:</u> See above details that are applicable to all forms of PA.		

¹¹¹ https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/829194/2a_Priority_habitats_2019_rev.pdf

¹¹² Water Resources South East Scoping Report [wrse-regional-plan-strategic-environmental-assessment-scoping-report.pdf](#)

Appendix B. Legislation, Plans and Programmes

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
INTERNATIONAL		
Bern Convention on the Conservation of European Wildlife and Natural Habitats (1979)	The principal aims of the Convention are to ensure conservation and protection of wild plant and animal species and their natural habitats (listed in Appendices I and II of the Convention), to increase cooperation between contracting parties, and to regulate the exploitation of those species (including migratory species) listed in Appendix 3. To this end the Convention imposes legal obligations on contracting parties, protecting over 500 wild plant species and more than 1000 wild animal species.	Ensure protection of biodiversity objective within SEA framework.
Bonn Convention on the Conservation of Migratory Species of Wild Animals (1983)	Contracting Parties work together to conserve migratory species and their habitats by providing strict protection for endangered migratory species (listed in Appendix 1 of the Convention), concluding multilateral Agreements for the conservation and management of migratory species which require or would benefit from international cooperation (listed in Appendix 2), and by undertaking cooperative research activities.	Ensure protection of biodiversity objective within SEA framework
Convention on Biological Diversity (1992)	Sets out a conservation plan to protect global biodiversity, and an international treaty to establish a fair and equitable system to enable nations to co-operate in accessing and sharing the benefits of genetic resources. The new global vision is "By 2050, biodiversity is valued, conserved, restored and wisely used, maintaining ecosystem services, sustaining a healthy planet and delivering benefits essential to all people".	Ensure protection of biodiversity objective within SEA framework.
Ramsar Convention - The Convention on Wetlands of International Importance (1971)	The Convention covers all aspects of wetland conservation and wise use. The Convention has three main 'pillars' of activity: the designation of wetlands of international importance as Ramsar sites; the promotion of the wise-use of all wetlands in the territory of each country; and international co-operation with other countries to further the wise-use of wetlands and their resources.	Ensure protection of biodiversity objective within SEA framework.
UN Framework Convention on Climate Change (1992)	The ultimate objective of the Convention is to achieve stabilization of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system.	Ensure reduction of greenhouse gas emissions objective within the SEA framework.
Kyoto Protocol to the UN Framework Convention on Climate Change (1997)	The Protocol operationalizes the United Nations Framework Convention on Climate Change by committing industrialized countries and economies in transition to limit and reduce greenhouse gases (GHG) emissions in accordance with agreed individual targets. The Convention itself only asks those countries to adopt policies and measures on mitigation and to report periodically.	Ensure reduction of greenhouse gas emissions objective within the SEA framework.
Commitments arising from the World Summit on	The Summit adopted a Political Declaration and Implementation Plan which included provisions covering a set of activities and measures to be taken in order to achieve development that takes into	Ensure protection of biodiversity objective within SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Sustainable Development, Johannesburg (2002)	account respect for the environment. There were decisions made in relation to water, energy, health, agriculture, biological diversity and other areas of concern.	
Paris Agreement (2015)	The Paris Agreement sets out a global framework to avoid dangerous climate change by limiting global warming to well below 2°C and pursuing efforts to limit it to 1.5°C. It also aims to strengthen countries' ability to deal with the impacts of climate change and support them in their efforts. To achieve this long-term temperature goal, countries aim to reach global peaking of greenhouse gas emissions as soon as possible to achieve a climate neutral world by mid-century.	Ensure reduction of greenhouse gas emissions objective within the SEA framework.
Charter for the Protection and Management of Archaeological Heritage (1990)	The Charter attempts to establish principles and guidelines of archaeological heritage management that are globally valid and can be adapted to national policies and conditions. The Charter encourages legislation to protect the archaeological heritage, based on inventories and general surveys of the resources. It lays out general principles for investigation, maintenance, and conservation as well as reconstruction of architectural heritage.	Ensure protection of historic environment objective within SEA framework.
The World Heritage Convention (1972)	This convention noted that the cultural heritage and the natural heritage are increasingly threatened with destruction not only by the traditional causes of decay, but also by changing social and economic conditions which aggravate the situation with even more formidable phenomena of damage or destruction, and considered that deterioration or disappearance of any item of the cultural or natural heritage constitutes a harmful impoverishment of the heritage of all the nations of the world.	Ensure protection of historic environment objective within SEA framework.
Convention on Access to Information, Public Participation in Decision making and Access to Justice in Environmental Matters (Aarhus Convention) (1998)	The Aarhus Convention is a multilateral environmental agreement through which the opportunities for citizens to access environmental information are increased and transparent and reliable regulation procedure is secured. It encourages access to information, public participation and access to justice.	The SEA will be consulted upon and open to scrutiny as per the requirement of the relevant regulations.
EUROPEAN		
Ambient Air Quality Directive (2008/50/EC)	This Directive includes the following key elements: • The merging of most of existing legislation into a single directive (except for the fourth daughter directive) with no change to existing air quality objectives* • New air quality objectives for PM2.5 (fine particles) including the limit value and exposure related objectives – exposure concentration obligation and exposure reduction target	Ensure protection of air quality objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	- The possibility to discount natural sources of pollution when assessing compliance against limit values - The possibility for time extensions of three years (PM10) or up to five years (NO2, benzene) for complying with limit values, based on conditions and the assessment by the European Commission.	
Thematic Strategy on Air Pollution (2005)	This thematic strategy on air pollution establishes interim objectives for air pollution in the EU and proposes appropriate measures for achieving them. It recommended that legislation be modernised, be better focused on the most serious pollutants and that more is done to integrate environmental concerns into other policies and programmes.	Ensure air quality objective within the SEA framework.
Clean Air Programme for Europe 2013	This programme contains measures to ensure that existing targets are met in the short term, and new air quality objectives for the period up to 2030. The package also includes support measures to help cut air pollution, with a focus on improving air quality in cities, supporting research and innovation, and promoting international cooperation. By 2030, and compared to business as usual, the clean air policy package is estimated to: - avoid 58 000 premature deaths across Europe, - save 123 000 km2 of ecosystems from nitrogen pollution (more than half the area of Romania), - save 56 000 km2 protected Natura 2000 areas (more than the entire area of Croatia) from nitrogen pollution, - save 19 000 km2 forest ecosystems from acidification.	Ensure protection of air quality objective within the SEA framework.
Establishing measures for the recovery of the stock of European eel 2007 (1100/2007)	This Regulation establishes a framework for the protection and sustainable use of the stock of European eel of the species <i>Anguilla anguilla</i> in Community waters, in coastal lagoons, in estuaries, and in rivers and communicating inland waters of Member States that flow into the seas in ICES areas III, IV, VI, VII, VIII, IX or into the Mediterranean Sea. Member States must identify and define the individual river basins lying within their national territory that constitute natural habitats for the European eel (eel river basins) and prepare an Eel Management Plan.	Ensure protection of biodiversity objective within SEA framework.
Directive on the Conservation of Wild Birds (79/409/EEC) (as amended)	The Directive provides wide ranging protection for Europe's wild birds. It identifies 194 species and sub-species of wild birds as endangered species requiring special conservation measures. Member states are required to create Special Protection Areas (SPAs) to protect endangered wild bird species.	Ensure protection of biodiversity objective within SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	It also bans activities that threaten wild birds such as taking bird eggs, destroying bird nests, capturing or deliberate killing of birds or trading in live or dead birds. To halt loss of biodiversity, it also limits the number of bird species that can be hunted and prescribes how hunting can be carried out.	
Our life insurance, our natural capital: an EU biodiversity strategy to 2020 (2011)	2050 vision: By 2050, European Union biodiversity and the ecosystem services it provides — its natural capital — are protected, valued and appropriately restored for biodiversity's intrinsic value and for their essential contribution to human wellbeing and economic prosperity, and so that catastrophic changes caused by the loss of biodiversity are avoided. 2020 headline target: Halting the loss of biodiversity and the degradation of ecosystem services in the EU by 2020, and restoring them in so far as feasible, while stepping up the EU contribution to averting global biodiversity loss.	Ensure protection of biodiversity objective within SEA framework.
Limiting Global Climate Change to 2 degrees Celsius - The way ahead for 2020 and beyond (2007)	This proposes that the EU pursues in the context of international negotiations the objective of 30 % reduction in greenhouse gas emissions (GHG) by developed countries by 2020 (compared to 1990 levels). This is necessary to ensure that the world stays within the 2°C limit. Until an international agreement is concluded, and without prejudice to its position in international negotiations, the EU should already now take on a firm independent commitment to achieve at least a 20 % reduction of GHG emissions by 2020. Other targets include: • Improve the EU's energy efficiency by 20 % by 2020. • Increase the share of renewable energy to 20 % by 2020	Ensure that climate change resilience is addressed within the SEA framework through the inclusion of an appropriate objective.
Fresh Water Fish Directive (2006/44/EC)	The Directive concerns the quality of fresh waters and applies to those waters designated by the Member States as needing protection or improvement in order to support fish life. The aim of the Directive is to protect or improve the quality of those running or standing fresh waters which support, or which, if pollution were reduced or eliminated, would become capable of supporting, fish belonging to: • indigenous species offering a natural diversity; • species the presence of which is judged desirable for water management purposes by the competent authorities of the Member States.	Ensure protection of biodiversity objective within SEA framework
Directive on the Conservation of Natural	Aims to protect wild plants, animals and habitats. Directive created a network of protected areas called Natura 2000 sites, including Special Areas of Conservation (SACs) – supporting rare,	Ensure protection of biodiversity objective within SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Habitats and of Wild Flora and Fauna (92/43/EEC)	endangered or vulnerable natural habitats, plants and animals (other than birds), and Special Protection Areas (SPAs) – supporting significant numbers of wild birds and their habitats.	
Birds Directive (2009/147/EC)	Europe is home to more than 500 wild bird species. But at least 32 % of the EU's bird species are currently not in a good conservation status. The Birds Directive aims to protect all of the 500 wild bird species naturally occurring in the European Union. Habitat loss and degradation are the most serious threats to the conservation of wild birds. The Directive therefore places great emphasis on the protection of habitats for endangered and migratory species. It establishes a network of Special Protection Areas (SPAs) including all the most suitable territories for these species. Since 1994, all SPAs are included in the Natura 2000 ecological network, set up under the Habitats Directive 92/43/EEC.	Ensure protection of biodiversity objective within SEA framework.
Directive on Animal health requirements for aquaculture animals and products thereof, and on the prevention and control of certain diseases in aquatic animals (2006/88/EC)	The Directive sets out animal health rules concerning aquaculture animals and related products. These rules shall apply to the marketing, importation and transit of such products. Additionally, the Directive establishes measures aimed at the prevention and control of diseases in aquaculture animals. Further provisions regard the issue of authorisations to aquaculture production businesses and processing establishments.	Ensure protection of animal health objective within SEA framework.
A Clean Planet for all: A European strategic long-term vision for a prosperous, modern, competitive and climate neutral economy (2018)	The aim of this long-term strategy is to confirm Europe's commitment to lead in global climate action and to present a vision that can lead to achieving net-zero greenhouse gas emissions by 2050 through a socially-fair transition in a cost-efficient manner. It underlines the opportunities that this transformation offers to European citizens and its economy, whilst identifying challenges ahead.	Ensure reduction of climate change objective within SEA framework.
Mainstreaming sustainable development into EU policies: 2009 Review of the European Union Strategy for Sustainable Development	It provides an overview of the progress made at EU level on the seven key challenges and cross-cutting themes since the last report in October 2007. These key challenges are: 1. Climate change and clean energy; 2. Sustainable transport; 3. Sustainable consumption and production; 4. Conservation and management of natural resources; 5. Public health; 6. Social inclusion, demography and migration; and 7. Global poverty and sustainable development challenges	Ensure reduction of climate change objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Directive on the assessment of the effects of certain plans and programmes on the environment (SEA Directive) (2001/42/EC)	The SEA Directive applies to a wide range of public plans and programmes (e.g. on land use, transport, energy, waste, agriculture, etc). An SEA is mandatory for plans/programmes which are: - are prepared for agriculture, forestry, fisheries, energy, industry, transport, waste/ water management, telecommunications, tourism, town & country planning or land use and which set the framework for future development consent of projects listed in the EIA Directive. OR - have been determined to require an assessment under the Habitats Directive.	Informative only.
The European Convention on the Protection of Archaeological Heritage (Valletta Convention) (1992)	Updates the previous 1969 Convention and makes conservation and enhancement of archaeological heritage a goal of urban and regional planning policies. It is concerned in particular with arrangements to be made for co-operation among archaeologists and town and regional planners in order to ensure optimum conservation of archaeological heritage. Sets guidelines for funding excavation and research work and publication of findings. Also deals with public access and educational actions to develop public awareness of the value of archaeological heritage.	Ensure protection of historic environment objective within SEA framework.
Seventh EU Environmental Action Plan 2013-2020	This action plan will be guiding European environment policy until 2020. In order to give more long-term direction it sets out a vision beyond that, of where it wants the Union to be by 2050: "In 2050, we live well, within the planet's ecological limits. Our prosperity and healthy environment stem from an innovative, circular economy where nothing is wasted and where natural resources are managed sustainably, and biodiversity is protected, valued and restored in ways that enhance our society's resilience. Our low-carbon growth has long been decoupled from resource use, setting the pace for a safe and sustainable global society." It identifies three key objectives: - to protect, conserve and enhance the Union's natural capital - to turn the Union into a resource-efficient, green, and competitive low-carbon economy - to safeguard the Union's citizens from environment-related pressures and risks to health and wellbeing. Other key aspects include the need for full integration of environmental requirements and considerations into other policies and to make EU cities more sustainable.	Ensure that issues such as carbon minimisation, biodiversity, waste reduction and managing natural resources sustainably are addressed via the SEA.
Promotion of the use of energy and renewable sources Directive (2009/28/EC)	The Renewable Energy Directive establishes an overall policy for the production and promotion of energy from renewable sources in the EU. It requires the EU to fulfil at least 20% of its total energy needs with renewables by 2020 – to be achieved through the attainment of individual national targets.	Ensure an objective considering alternative / renewable technologies for energy production is

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	All EU countries must also ensure that at least 10% of their transport fuels come from renewable sources by 2020.	included within the SEA framework.
Energy Act 2013	This Act will establish a legislative framework for delivering secure, affordable and low carbon energy and includes provisions on: • Decarbonisation • Electricity market Reform • Nuclear Regulation • Government pipe-line and storage system • Strategy and policy statement • Consumer protection	Ensure an objective relating to the prudent use of natural resources (including energy) is included within the SEA framework.
Energy Efficiency Directive (2012/27/EU)	The 2012 Energy Efficiency Directive establishes a set of binding measures to help the EU reach its 20% energy efficiency target by 2020. Under the Directive, all EU countries are required to use energy more efficiently at all stages of the energy chain from its production to its final consumption. On 30 November 2016 the Commission proposed an update to the Energy Efficiency Directive including a new 30% energy efficiency target for 2030, and measures to update the Directive to make sure the new target is met.	Ensure an objective relating to the prudent use of natural resources (including energy) is included within the SEA framework.
EU Strategy on Adaptation to Climate Change	The EU strategy on adaptation to climate change aims at making Europe more climate-resilient. Taking a coherent approach by complementing the activities of Member States, it supports action by promoting greater coordination and information-sharing and by ensuring that adaptation considerations are addressed in all relevant EU policies.	Ensure an objective relating to extreme weather resilience is included within the SEA framework.
European Commission Environmental Liability Directive (2004/35/EC)	The Directive related to the prevention and remedying of environmental damage (ELD) establishes a framework based on the polluter pays principle to prevent and remedy environmental damage. It defines "environmental damage" as damage to protected species and natural habitats, damage to water and damage to soil.	Ensure an objective relating to environmental damage is included within the SEA framework.
The Nitrates Directive (91/676/EEC)	The Directive aims to improve water quality by protecting water against pollution caused by nitrates from agricultural sources. In particular, it is about promoting better management of animal manures, chemical nitrogen fertilisers and other nitrogen-containing materials spread onto land.	Ensure protection of water quality objective within the SEA framework.
The Convention for the Protection of the Architectural Heritage of	The main purpose of the Convention is to reinforce and promote policies for the conservation and enhancement of Europe's heritage. It also affirms the need for European solidarity with regard to heritage conservation and is designed to foster practical co-operation among the Parties. It	Ensure protection of historic environment

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Europe (Granada Convention) (1985)	establishes the principles of "European co-ordination of conservation policies" including consultations regarding the thrust of the policies to be implemented.	objective within SEA framework.
The Environmental Noise Directive (2002/49/EC)	This Directive relates to the assessment and management of environmental noise and is the main EU instrument to identify noise pollution levels and to trigger the necessary action both at Member State and at EU level. To pursue its stated aims, the Environmental Noise Directive focuses on three action areas: 1. the determination of exposure to environmental noise 2. ensuring that information on environmental noise and its effects is made available to the public 3. preventing and reducing environmental noise where necessary and preserving environmental noise quality where it is good The Directive applies to noise to which humans are exposed, particularly in built-up areas, in public parks or other quiet areas in an agglomeration, in quiet areas in open country, near schools, hospitals and other noise-sensitive buildings and areas. It does not apply to noise that is caused by the exposed person himself, noise from domestic activities, noise created by neighbours, noise at work places or noise inside means of transport or due to military activities in military areas. The Directive requires Member States to prepare and publish, every 5 years, noise maps and noise management action plans for: • agglomerations with more than 100,000 inhabitants • major roads (more than 3 million vehicles a year) • major railways (more than 30.000 trains a year) • major airports (more than 50.000 movements a year, including small aircrafts and helicopters)	Ensure that the health and well-being of people is addressed through an objective in the SEA framework and that noise issues are considered.
WHO Guidelines for Community Noise 1999	The World Health Organisation (WHO) publication entitled 'Guidelines for Community Noise' (1999), provides guidance with regard to recommended internal and external noise levels for various building uses, outlining the potential health impacts associated with noise. Specifically, the document recommends internal and external noise levels that would provide an acoustic environment that is conducive to uninterrupted speech and sleep.	Ensure that the health and well-being of people is addressed through an objective in the SEA framework and that noise issues are considered.
WHO Night Noise Guidelines for Europe 2009	The World Health Organisation (WHO) Night Noise Guidelines for Europe (NNG) 2009 are health-based guidelines and are to be considered an extension and update to the WHO Guidelines for Community Noise 1999.	Ensure that the health and well-being of people is addressed through an objective in the SEA

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	WHO NNG provides evidence based policy advice to member states in the development of future legislation and policy action in the area of control and surveillance of night noise exposure.	framework and that noise issues are considered.
The European Landscape Convention (2006)	Promotes landscape protection, management and planning, and European co-operation on landscape issues. The Convention recognizes that the landscape is shaped by natural and cultural influences. Highlights the importance of developing landscape policies dedicated to the protection, management and creation of landscapes, and establishing procedures for the general public and other stakeholders to participate in policy creation and implementation.	Ensure a landscape objective is included in the SEA framework.
Blueprint to Safeguard Europe's Water Resources (2012)	It presents the policy response to the challenges presented in the State of Water Report and its long-term aim is to ensure sufficient availability of good quality water for sustainable and equitable water use. It is closely linked to EU 2020 Strategy and Resource Efficiency Roadmap.	Ensure that protection of water resources is included as an objective within the SEA framework
Urban Wastewater Treatment Directive (91/271/EEC)	The Directive protects the water environment from the adverse effects of discharges of urban waste water and from certain industrial discharges. It concerns the collection, treatment and discharge of urban waste water.	Ensure protection of water quality objective within the SEA framework.
The Water Framework Directive (WFD) (2000/60/EC)	Looks at the ecological health of surface water bodies as well as traditional chemical standards. In particular it will help deal with, amongst others diffuse pollution, habitat, ecology, hydromorphology, barriers to fish movement, water quality, flow and sediment. Successful implementation will help to protect all elements of the water cycle and enhance the quality of our groundwater, rivers, lakes, estuaries and seas.	Ensure protection of surface water quality forms part of SEA framework.
Thematic Strategy for Soil Protection (2006)	The overall objective of this strategy is protection and sustainable use of soil, based on the following guiding principles: 1. Preventing further soil degradation and preserving its functions: 2. when soil is used and its functions are exploited, action has to be taken on soil use and management patterns, and 3. when soil acts as a sink/receptor of the effects of human activities or environmental phenomena, action has to be taken at source. 4. Restoring degraded soils to a level of functionality consistent at least with current and intended use, thus also considering the cost implications of the restoration of soil.	Ensure that protection of soil resources is included as an objective within the SEA framework
European Soils Charter (2003)	The Charter recognises that: • Soil is a precious asset; • Soil is a limited resource which is easily destroyed;	Ensure that protection of soil resources is included as an objective within the SEA framework

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	- Land has a wide variety of uses and a proper planning policy is needed by Governments for urban development and civil engineering projects; - Farmers and foresters must preserve the soils quality; - Soil must be protected from erosion and pollution; - Further research and collaboration is required to ensure the wise use and conservation of soil.	
Drinking Water Directive (1998/83/EC)	The Directive concerns the quality of water intended for human consumption. Its objective is to protect human health from adverse effects of any contamination of water intended for human consumption by ensuring that it is wholesome and clean. The Drinking Water Directive applies to: - all distribution systems serving more than 50 people or supplying more than 10 cubic meter per day, but also distribution systems serving less than 50 people/supplying less than 10 cubic meter per day if the water is supplied as part of an economic activity; - drinking water from tankers; - drinking water in bottles or containers; - water used in the food-processing industry, unless the competent national authorities are satisfied that the quality of the water cannot affect the wholesomeness of the foodstuff in its finished form.	Ensure protection of water quality objective within the SEA framework.
Groundwater Directive (2006/118/EC)	Establishes a regime which sets underground water quality standards and introduces measures to prevent or limit inputs of pollutants into groundwater. Establishes quality criteria taking account of local characteristics. Member States have to establish standards at the most appropriate level and take into account local or regional conditions. It requires groundwater quality standards to be established by the end of 2008; pollution trend studies to be carried out by using existing data and mandatory WFD data; pollution trends to be reversed so that environmental objectives are achieved by 2015; measures to prevent or limit inputs of pollutants into groundwater; reviews of technical provisions of the directive to be carried out in 2013 and every six years thereafter; compliance with good chemical status criteria. This directive was replaced by the WFD at the end of 2013.	Ensure protection of groundwater quality forms part of the SEA framework.
Marine Strategy Framework Directive (2008/56/EEC)	The Directive aims to achieve Good Environmental Status (GES) of the EU's marine waters by 2020 and to protect the resource base upon which marine-related economic and social activities depend. It is the first EU legislative instrument related to the protection of marine biodiversity, as it contains the explicit regulatory objective that "biodiversity is maintained by 2020", as the cornerstone for achieving GES.	Ensure protection of marine environment is included as an Objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Directive on Bathing Water (76/160/EEC); and Directive 2006/7/EC repealing Directive 76/160/EEC (from 2014)	The Directive establishes provisions for the monitoring and classification of bathing water quality; the management of bathing water quality; and the provision of information to the public on bathing water quality. Member States are required to annually identify all bathing waters and define the length of the bathing season.	Ensure protection of bathing water quality is included as an Objective within the SEA framework.
Directive on the Assessment and Management of Flood Risks (2007/60/EC)	Concerns the assessment and management of flood risk and requires Member States to assess if all water courses and coast lines are at risk from flooding, to map the flood extent and assets and humans at risk in these areas and to take adequate and coordinated measures to reduce this flood risk. Also reinforces the rights of the public to access this information and to have a say in the planning process.	Ensure an objective covering flooding is considered within the SEA framework.
Waste Framework Directive (75/442/EEC)	The original aim of the Waste Framework Directive was to lay the basis to turn the EU into a recycling society and contained 5 key steps in the waste hierarchy concept: • Prevention • Reuse • Recycle • Recovery • Disposal The revised Waste Directive introduces new provisions aimed at boosting waste prevention and recycling as part of the waste hierarchy and clarifies key concepts such as the definition of waste, recovery and disposal.	Ensure that the issue of the prudent use of natural resources and waste reduction are considered in the SEA framework through an Objective.
NATIONAL		
Environment Act 2021	The Act will deliver: • Long-term targets to improve air quality, biodiversity, water, and waste reduction and resource efficiency; • A target on ambient PM2.5 concentrations, the most harmful pollutant to human health; • A target to halt the decline of nature by 2030; • Environmental Improvement Plans, including interim targets; • A cycle of environmental monitoring and reporting; • Environmental Principles embedded in domestic policy making; and • Office for Environmental Protection to uphold environmental law.	Ensure protection of biodiversity objective within SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
The Eels (England & Wales) Regulations 2009 (as amended)	The regulations establish measures for the recovery of the stock of European eel. They set out the following requirements; • The requirement to notify the Environment Agency of the construction, alteration or maintenance of any structure likely to affect the passage of eels • Where any such structure exists, the requirement to construct and operate an eel pass to allow the free passage of eels • The removal of any obstruction, if deemed necessary • The use of eel screens to exclude eels from water abstraction and discharge points • If necessary, the use of a by-wash to return excluded eels to the waters they came from.	Ensure protection of biodiversity objective within SEA framework.
UK Post-2010 Biodiversity Framework (2012)	This is a Framework that covers the period from 2011 to 2020, and was developed in response to two main drivers: the Convention on Biological Diversity's (CBD's) Strategic Plan for Biodiversity 2011-2020 and its 5 strategic goals and 20 'Aichi Biodiversity Targets', published in October 2010; and the EU Biodiversity Strategy (EUBS), released in May 2011. The Framework shows how the work of the four UK countries joins up with work at a UK level to achieve the 'Aichi Biodiversity Targets' and the aims of the EU biodiversity strategy. It identifies the activities required to complement the country biodiversity strategies, and where work in the country strategies contributes to international obligations. In total, 23 areas of work have been identified where all the countries have agreed that they want to contribute to, and benefit from, a continued UK focus, and an Implementation Plan was published in November 2013.	Ensure protection of biodiversity objective within SEA framework.
25 Year Environment Plan, 2018	The Government's 25-Year Environment Plan sets out the Government's position on environmental improvements, focussed on delivering cleaner air and water across the country, protecting at-risk wildlife, and improving natural habitats. The Plan introduces and references a number of external targets. Importantly it notes that 40% of the UK's final energy consumption is the responsibility of the transport sector. The plan includes: • meeting legally binding targets to reduce emissions of five damaging air pollutants (intended to halve the effects of air pollution on health by 2030); • ending the sale of new conventional petrol and diesel cars and vans by 2040; • continuing to cut greenhouse gas emissions including from land use, land use change, the agriculture and waste sectors and the use of fluorinated gases; and • making sure that all policies, programmes and investment decisions take into account the possible extent of climate change this century.	The SEA will need to consider implications for air and water quality, at risk wildlife and improving natural habitats.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	The plan emphasises the assumed benefits of the UK's departure from the EU in allowing for a reorganisation and reprioritisation of the UK's efforts related to the environment. Specific examples are not given, however the challenging targets listed, as summarised above, do offer strong opportunities to set high environmental standards.	
Salmon and Freshwater Fisheries Act 1975	The Act dictates which methods of fishing for salmon, trout and freshwater fish are an offence and also includes offences against the use and dealing with roe, spawning and unclean fish. The Act also deals with problems of pollution making it an offence to knowingly permit the flow of poisonous matter and polluting effluents into river courses. Part II of the Act deals with obstructions to the passage of fish, including fishing weirs, screens and sluices; dictating when and where they can be used. Part III explains the proper times of fishing, selling and exporting fish.	Ensure protection of biodiversity objective within SEA framework.
The Conservation of Habitats and Species Regulations (2010) (as amended)	This act consolidates all the various amendments made to the Conservation (Natural Habitats, &c.) Regulations 1994 in respect of England and Wales. The Regulations provide for the designation and protection of 'European sites', the protection of 'European protected species', and the adaptation of planning and other controls for the protection of European Sites.	Potential effects on areas designated for nature conservation at the European level will need to be considered through the HRA process.
The Conservation of Habitats and Species (Amendment) (EU Exit) Regulations (2019)	The Regulations ensure that the habitat and species protection and standards derived from EU law will continue to apply after Brexit.	Ensure protection of biodiversity objective within SEA framework.
Natural Environment White Paper (2011)	The Natural Environment White Paper has four ambitions: • Protecting and improving our natural environment; • Growing a green economy; • Reconnecting people and nature International; and • EU leadership. It looks at ecosystem services provided by natural systems and promotes a step-change in nature conservation which makes sustainable use of natural capital and natural networks by working at a	Ensure biodiversity and landscape form part of SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	landscape scale. It aims to ensure that by 2020 17% of England is managed effectively to safeguard biodiversity.	
Biodiversity 2020: A strategy for England's wildlife and ecosystem services, Defra (2011)	This is a new biodiversity strategy for England which builds on the Natural Environment White Paper and provides a comprehensive picture of how the government are implementing international and EU commitments. It sets out the strategic direction for biodiversity policy for the next decade on land (including rivers and lakes) and at sea. It builds on the successful work that has gone before, but also seeks to deliver a real step change	Ensure the protection and enhancement of biodiversity is included as an objective within the SEA.
UK Biodiversity Plan (1994)	This document represents the first United Kingdom biodiversity action plan. It contains three sections; • Section 1 – describes the UK's biological resources and their global importance as well as the range of biodiversity within the UK from a historical and geological importance • Section 2- describes the UK's strategy and programmes and examines threats, problems and opportunities of biodiversity. • Section 3- draws the components of the action plan together and provides a forward work programme.	Ensure the protection and enhancement of biodiversity is included as an objective within the SEA.
Guidance for Local Authorities on Implementing the Biodiversity Duty (2007)	The guidance is intended to assist local authorities in meeting the Biodiversity Duty. The conservation of biodiversity is highly dependent on the extent to which it is addressed in infrastructure and development projects and how well the planning process integrates biodiversity into planning and development control policies. Core Strategies and Local Development Plan Strategies set out the overarching policy framework for the plan area. Strategic objectives and policies should be developed for biodiversity, including objectives for enhancement. Consideration should also be given to how biodiversity enhancement can be used to bring about more sustainable development, through integration with other policy objectives and other land uses, for example housing and economic development, health, education and social inclusion.	Ensure biodiversity objective within the SEA framework.
National Forest Inventory	This programme monitors woodland and trees within Great Britain. It includes the most in depth survey carried out on Britain's woodland and trees to date. The NFI provides an extensive and unique record of key information about our forests and woodlands. Woodland surveys and compiled forest inventories have been carried out at 10-15 year intervals since 1924.	Ensure flora and fauna is considered within the SEA framework
Ancient Woodland Inventory	The AWI is a provisional guide and map based tool to the location of Ancient and long established Woodland. Ancient woodland is defined as land that is currently wooded and has been continually wooded in England at least since 1600. This type of woodland has important biodiversity and cultural values by its virtue of its antiquity.	Ensure flora and fauna is considered within the SEA framework

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Heritage Protection for the 21st Century 2007	The paper sets out a vision of a unified and simpler heritage protection system, which will have more opportunities for public involvement and community engagement. The proposed system will be more open, accountable and transparent. It will offer all those with an interest in the historic environment a clearer record of what is protected and why; it will enable people who own or manage historic buildings and sites to have a better understanding of what features are important; it will streamline the consent procedures and create a more consultative and collaborative protection system. It is predominantly aimed for England and Wales with some UK wide elements.	Ensure historic environment objective within SEA framework.
Making Space for Nature - A review of England's Wildlife Sites and Ecological Network (2010)	The review looked at England's wildlife sites and whether they are capable of responding and adapting to the growing challenges of climate change. It makes 24 recommendations for practical action to Make Space for Nature and achieve a coherent and resilient ecological network. s. Five themes unite them: i. We need to continue the recent progress in improving the management and condition of wildlife sites, particularly our SSSIs. We also make recommendations for how these should be designated and managed in ways that enhance their resilience to climate change. ii. We need to properly plan ecological networks, including restoration areas. Restoration needs to take place throughout England. However, in some areas, both the scale of what can be delivered to enhance the network, and the ensuing iii. There are a large number of surviving patches of important wildlife habitat scattered across England outside of SSSIs, for example in Local Wildlife Sites. We need to take steps to improve the protection and management of these remaining wildlife habitats. 'Protection' will usually be best achieved through incentive-based mechanisms, but at times may require designation. iv. We need to become better at deriving multiple benefits from the ways we use and interact with our environment. There are many things that society has to do that may seem to have rather little to do with nature conservation, but could have, or even should have if we embrace more radical thinking; flood management by creating wetlands is an obvious example. We need to exploit these 'win-win' opportunities to the full. Being better at valuing a wider range of ecosystem services would help this process. v. We will not achieve a step-change in nature conservation in England without society accepting it to be necessary, desirable, and achievable. This will require strong leadership from government and significant improvements in collaboration between local authorities, local communities, statutory agencies, the voluntary and private sectors, farmers, landowners and other land-managers and individual citizens.	Ensure protection of biodiversity objective within SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Delivering a healthy natural environment. Ecosystem approach action plan, Defra (2010)	The plan has priority areas for action that will be fundamental to the success and to securing wider engagement at the national, regional and local levels: • Priority area 1: Promoting joined-up working within Defra and the Defra network to deliver environmental outcomes more effectively • Priority area 2: Identifying opportunities for mainstreaming an ecosystems approach • Priority area 3: Using case studies that demonstrate the benefits of taking an ecosystems approach • Priority area 4: Developing ways of valuing ecosystem services • Priority area 4: Developing ways of valuing ecosystem services	Ensure protection of biodiversity objective within SEA framework.
The Great Britain Invasive Non-Native Species Strategy, Defra (2015)	This Strategy aims to address invasive non-native species (INNS) issues in Great Britain, maintaining the approach of the 2008 Strategy and the 2003 policy review. The vision is that if this Strategy is fully implemented, biodiversity, quality of life and economic interests in GB will be better protected against the adverse impacts of INNS because there will be: • widespread awareness and understanding of the risks and adverse impacts associated with INNS, and greater vigilance against these; • integration of INNS within the broader biosecurity agenda; • a strong sense of shared responsibility across government, key stakeholder organisations, land managers and the general public for action and behaviour that will reduce the threats posed by INNS; • a guiding framework for national, regional and local mitigation, control or eradication initiatives helping to reduce the detrimental impact of INNS; and • improved co-ordination and co-operation on INNS issues at a European and international level.	Ensure protection of biodiversity objective within SEA framework.
The Invasive Alien Species (Enforcement and Permitting) Order 2019	This Order allows for the enforcement of Regulation (EU) No. 1143/2014 on the prevention and management of the introduction and spread of invasive alien species in England and Wales, including the relevant licences, permits and rules for keeping invasive alien species.	Ensure protection of biodiversity objective within SEA framework.
Conservation 21 - Natural England's Conservation Strategy for the 21st	The strategy sets out Natural England's thinking about what needs to be done differently and how we need to work with others, to better deliver this shared ambition. The strategy's 3 guiding principles are to:	Ensure protection of biodiversity objective within SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Century, Natural England (2016)	• create resilient landscapes and seas • put people at the heart of the environment • grow natural capital	
State of Natural Capital Annual Report 2020, Natural Capital Committee (2020)	This report sets out the work done by the committee since March 2019. It sets out what should be included in the Environment Bill and the progress made to date on the goals of the 25 Year Environment Plan.	Ensure protection of biodiversity objective within SEA framework.
A narrative for conserving freshwater and wetland habitats in England, Natural England (2016)	This narrative provides an overview of circumstances relating to the conservation of freshwater and wetland habitats in England, considering their ecological function, the natural and anthropogenic factors affecting them, the principles that should be applied to their management, and the respective roles of the main policy mechanisms involved in their conservation. It covers all running and standing water habitats, of whatever size, and terrestrial wetland habitats including bogs, fens, swamp and wet woodland.	Ensure protection of biodiversity objective within SEA framework.
The National Adaptation Programme and the Third Strategy for Climate Adaptation Reporting, Defra (2018)	This second National Adaptation Programme (NAP) sets out government's response to the second Climate Change Risk Assessment (CCRA), showing the actions government is, and will be, taking to address the risks and opportunities posed by a changing climate. It forms part of the five-yearly cycle of requirements laid down in the Climate Change Act 2008 to drive a dynamic and adaptive approach to building our resilience to climate change. The NAP explains the range of climate risks which affect our natural environment, our critical infrastructure services, our communities and buildings, local government and businesses	Ensure that climate change resilience is addressed within the SEA framework through the inclusion of an appropriate objective.
UK Climate Change Risk Assessment, Defra (2017)	The assessment identifies the top six areas of inter-related climate change risks for the UK as; • Flooding and coastal change risks to communities, businesses and infrastructure; • Risks to health, well-being and productivity from high temperatures; • Risks of shortages in the public water supply for agriculture, energy generation and industry; • Risks to natural capital including terrestrial, coastal, marine and freshwater ecosystems, soils and biodiversity; • Risks to domestic and international food production and trade; and • New and emerging pests and diseases and invasive non-native species affecting people, plants and animals.	Ensure that climate change resilience is addressed within the SEA framework through the inclusion of an appropriate objective.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Climate Change Act 2008 and its 2050 Target Amendment Order, 2019	The Act aims to improve carbon management, helping the transition towards a low-carbon economy in the UK and to demonstrate UK leadership internationally. Key provisions of the Act include: • a legally binding target of at least an 80% cut in greenhouse gas emissions by 2050 and a reduction in emissions of at least 34% by 2020 (both against 1990 baseline). Note the 2050 target has now been amended to Net Zero • a carbon budgeting system that caps emissions over five-year periods; • creation of the Committee on Climate Change; • further measures to reduce emissions, including measures on biofuels; • a requirement for the Government to report at least every five years on the risks to the UK of climate change, and to publish a programme setting out how these will be addressed. The Act also introduces powers for Government to require public bodies and statutory undertakers to carry out their own risk assessment and make plans to address those risks	Ensure that climate change resilience is addressed within the SEA framework through the inclusion of an appropriate objective. Note also the amended Target of Net Zero by 2050.
Carbon Plan: Delivering our low carbon future 2011	This plan sets out how the UK will achieve decarbonisation within the framework of energy policy: to make the transition to a low carbon economy while maintaining energy security, and minimising costs to consumers, particularly those in poorer households. It outlines the progress so far in terms of emissions as well the future vision in order to cut emissions by 80% by 2050.	Ensure that reduction of Carbon is included as an Objective within the SEA. Ensure that the prudent use of natural resources (including energy) is included as an Objective within the SEA.
Planning Practice Guidance – Climate Change 2015	Advises how planning can identify suitable mitigation and adaptation measures in plan-making and the planning application process to address the potential impacts of climate	Ensure that climate change resilience is addressed within the SEA framework through the inclusion of an appropriate objective.
Clean Growth Strategy 2017	The Clean Growth Strategy deals specifically with the challenge of trying to grow the UK's economy whilst reducing its emissions. This issue is dealt with across multiple strategies, and several sectors have a large role to play. This strategy details the approach of each sector and sets out key policies for each The guiding principles of the Clean Growth Strategy are to, through nurturing low carbon technologies, processes, and systems: • meeting the UK's domestic commitments at the lowest possible net cost to UK taxpayers, consumers, and businesses; and	SEA needs to recognise and set Objectives that will reduce emissions of Carbon and other GHG, as well as other air pollutants.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	• maximising the social and economic benefits for the UK from this transition. The key policies to achieve this are sorted into the following categories: • accelerating clean growth; • improving business and industry efficiency (25% of emissions); • improving our homes (13% of emissions); • accelerating the shift to low carbon transport (24% of emissions); • delivering clean, smart, flexible power (21% of emissions); • enhancing the benefits and value of our natural resources (15% of emissions); • leading in the public sector (2% of emissions); and • government leadership in driving clean growth.	
National Planning Policy Framework (NPPF) (2019)	Sets out Government planning policy for England. The purpose of the planning system is to contribute to the achievement of sustainable development, the three dimensions of which are: • economic role – contributing to building a strong, responsive and competitive economy, by ensuring that sufficient land of the right type is available in the right places and at the right time to support growth and innovation; and by identifying and coordinating development requirements, including the provision of infrastructure; • a social role – supporting strong, vibrant and healthy communities, by providing the supply of housing required to meet the needs of present and future generations; and by creating a high quality built environment, with accessible local services that reflect the community's needs and support its health, social and cultural well-being; environmental role – contributing to protecting and enhancing our natural, built and historic environment; and, as part of this, helping to improve biodiversity, use natural resources prudently, minimize waste and pollution, and mitigate and adapt to climate change including moving to a low carbon economy.	The SEA will need to consider full range of sustainability issues set out in the NPPF. This is a core document and area of consideration.
National Infrastructure Plan (2014)	The National Infrastructure Plan (NIP) 2014 presents an overview of the government's policies, investments and record on infrastructure delivery since 2010. The document identifies that over 2,500 different projects or schemes have been delivered in this Parliament. It also details the government's approach to ensuring that the Top 40 priority investments remain on track to deliver, as well as providing the latest detail on the timing, funding and status of each of them. The plan consolidates and builds on the progress already made by providing the clarity and visibility that industry, the supply chain and investors need going forwards. In addition to the pipeline, the document provides information on the government's ongoing work to improve the planning,	SEA needs to consider potential for cumulative effects with other developments.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	performance and delivery of infrastructure and addresses longer term challenges, for example by incorporating analysis of the financing requirements for our infrastructure.	
Securing the Future – Delivering the UK Sustainable Development Strategy (2005)	The Strategy takes account of developments since the 1999 Strategy, both domestically and internationally; the changed structure of government in the UK with devolution to Scotland, Wales and Northern Ireland; greater emphasis on delivery at regional level and the new relationship between government and local authorities. It highlights the renewed international push for sustainable development from the World Summit on Sustainable Development in Johannesburg in 2002.	Ensure inclusion of sustainable development objective within SEA framework.
A Green Future: Our 25 Year Plan to Improve the Environment, UK Government (2018)	This 25 Year Environment Plan sets out government action to help the natural world regain and retain good health. It aims to deliver cleaner air and water in our cities and rural landscapes, protect threatened species and provide richer wildlife habitats. It identifies six key areas around which action will be focused. These are: • Using and managing land sustainably • Recovering nature and enhancing the beauty of landscapes • Connecting people with the environment to improve health and wellbeing • Increasing resource efficiency, and reducing pollution and waste • Securing clean, productive and biologically diverse seas and oceans • Protecting and improving the global environment	Ensure protection of biodiversity and landscapes objective within SEA framework.
The Natural Choice: Securing the Value of Nature, Defra (2011)	It sets out its ambition as ‘We want to improve the quality of our natural environment across England, moving to a net gain in the value of nature. We aim to arrest the decline in habitats and species and the degradation of landscapes. We will protect priority habitats and safeguard vulnerable non-renewable resources for future generations. We will support natural systems to function more effectively in town, in the country and at sea. We will achieve this through joined-up action at local and national levels to create an ecological network which is resilient to changing pressures.’	The SEA will need to consider need for improvements to nature and recovery of biodiversity.
Environment Bill Policy Statement 2020	The Government’s Environment Bill Policy Statement introduces new incentives, actions and planning tools to drive further improvements for nature. The Bill introduces a mandatory requirement for Biodiversity Net Gain in the planning system, to ensure that new developments contribute to the recovery of biodiversity and this requirement can also create new green spaces for local communities to enjoy. It also adds a new concept of Local Nature Recovery Strategies.	The SEA will need to consider need for improvements to nature and recovery of biodiversity.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Environmental Protection Act 1990	This act brings in a system of integrated pollution control for the disposal of wastes to land, water and air. There are three parts of the Act. These are: - Part I- establishes integrated pollution control and gives Local Authorities new powers to control air pollution from a range of prescribed processes; - Part II- improves the rules on waste disposal; and - Part III- covers statutory nuisances and clean air.	Ensure protection of Natura 2000 sites
Marine and Coastal Access Act (2009)	The Act introduced a revised system of marine management and licensing, including marine planning which makes provisions for general government marine environment policies, as well as those policies of the devolved administrations. It also made changes to the management of marine, migratory and freshwater fisheries, marine conservation, as well as recreational access to the English and Welsh coasts.	Ensure biodiversity objective within SEA framework.
The Natural Environment and Communities Act 2006 (NERC Act)	Section 40 of the Act requires all public bodies to have regard to biodiversity conservation when carrying out their functions. This is commonly referred to as the 'biodiversity duty'. The aim of the biodiversity duty is to raise the profile of biodiversity in England and Wales, so that the conservation of biodiversity becomes properly embedded in all relevant policies and decisions made by public authorities.	Ensure biodiversity objective within SEA framework.
The Wildlife and Countryside Act 1981 (as amended)	The Act prohibits certain methods of killing or taking wild animals; amends the law relating to protection of certain mammals; restricts the introduction of certain animals and plants; amends the Endangered Species (Import and Export) Act 1976; amends the law relating to nature conservation, the countryside and National Parks; and amends the law relating to public rights of way.	Ensure biodiversity and accesses to services are covered by objectives within SEA framework.
Countryside and Rights of Way (CROW) Act 2000	This Act contains five Parts and 16 Schedules and provides for public access on foot to certain types of land, amends the law relating to public rights of way, increases measures for the management and protection for Sites of Special Scientific Interest (SSSI) and strengthens wildlife enforcement legislation, and provides for better management of Areas of Outstanding Natural Beauty (AONB).	Ensure that the issue of access to the countryside and protection of landscapes is considered as part of the SEA.
National Parks and Access to the Countryside Act 1949	This was an act that made provision for National Parks and the establishment of a National Parks Commission. It was also to confer on the Nature Conservancy and local authorities' powers for the establishment and maintenance of nature reserves, it made further provision for the recording, creation, maintenance and improvement of public paths and for securing access to open country and to amend laws relating to rights of way.	Ensure that an objective relating to protecting the character and quality of important landscapes is included within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
National Parks and Access to Countryside Act 2006	The Act established powers to declare National Nature Reserves (NNRs); to notify sites of Sites of Special Scientific Interest (SSSI's) and for local authorities to establish Local Nature Reserves (LNRs). These provisions were strengthened by the Wildlife & Countryside Act 1981. An NNR is an area which is among the best examples of a particular habitat. NNRs are of national importance. They are in many cases owned and managed by the statutory authority, (for example English Nature), but not always. An NNR, unlike an SSSI, has to be managed appropriately to retain its special status.	Ensure protection of sites designated for nature conservation at the national and local level are protected.
Creating a better place: Our ambition to 2020, Environment Agency (2018)	This outlines the Environment Agency's ambitions for how it planned to protect and improve natural resources, alongside Defra's proposed 25-year environment plan, leading up to the year 2020. Its principles are; • Put people and wildlife first: our goal is to create a better place for them. • 80/20: we will focus on the 20% that makes 80% of the difference. • Support local priorities: every place and community has its own needs.	Ensure that the issue of natural resources protection and enhancement is included as an Objective within the SEA framework.
Health Impact Assessment in Strategic Environmental Assessment (2001)	This is a review of Health Impact Assessment concepts, methods and practices to support the development of a protocol on Strategic Environmental Assessment which adequately covers health impacts. It discusses how decisions taken outside of the health sector can affect the health of individuals and populations by modifying their physical and social environment, and how this in turn affects social and economic development. It describes methods, procedures and practices to carry out health impact assessments of policies, plans and projects, highlighting the similarities with and opportunities for integrating health impact assessment within strategic environmental assessments, and other forms of impact assessment under use. It also draws attention to the opportunities for achieving health benefits and avoiding health costs by considering health impacts early in the planning process. It is aimed at inspiring policy makers to include health considerations early in their planning process by showing how different perspectives can feasibly be incorporated into everyday decisions.	SEA needs to consider health impacts and needs to note all elements of this document.
Healthy Lives, Healthy People: Our strategy for public health in England (2010)	This white paper sets out the government's long-term vision for the future of public health in England. The aim is to create a 'wellness' service (Public Health England) and to strengthen both national and local leadership. The plans set out put local communities at the heart of public health. It states that central control will end and give local government the freedom, responsibility and funding to innovate and develop their own ways of improving public health in their area. There will also be real financial incentives to reward	SEA needs to consider all vulnerable groups, as well as the wider population.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	their progress on improving health and reducing health inequalities, and greater transparency so people can see the results they achieve.	
Fixing the foundations: Creating a more prosperous nation, HM Government (2015)	This document sets out a 15-point plan that the government will put into action to boost the UK's productivity growth, centred around two key pillars: encouraging long-term investment, and promoting a dynamic economy. It sets out the government's long-term strategy for tackling the issues that matter most for productivity growth.	
Contaminated Land (England) Regulations 2006	Outlines the regulations on contaminated land in order to prevent new land becoming contaminated by polluting substances whilst also tackling historic contamination of sites as it poses risks to human health and the environment.	Ensure that the issue of contamination is addressed through an Objective in the SEA framework.
Environmental Damage (Prevention and Remediation) (England) Regulations 2015	These regulations came into force on 19th July 2015. They impose obligations on operators of certain activities requiring them to prevent or remediate environmental damage. They apply to damage to protected species, natural habitats, sites of special scientific interest (SSSIs), water and land	Ensure that the issue of protection and enhancement of biodiversity and designated sites is addressed through an Objective in the SEA framework.
National Review of Waste Policy in England 2011	This document is a review of waste policy in England and is guided by a waste hierarchy which is a guide to sustainable waste management and a legal requirement. Key objectives are the use of more sustainable approaches to the use of materials and to improve the service to householders and businesses in order to deliver environmental benefits and support economic growth. This review covers a range of topics including: • Sustainable use of materials and waste prevention • Regulations and enforcement • Food waste • Energy recovery • Infrastructure and planning • Next steps in waste policy.	Ensure that waste minimisation and resource efficiency are included as an Objective within the SEA.
Waste Management Plan for England	This document provides an analysis of the current waste management situation in England and fulfils the mandatory requirements of article 28 of the revised Waste Framework Directive (rWFD).	No implications. Informative only.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	The plan does not introduce new policies or change the landscape of how waste is managed in England. Its core aim is to bring current waste management policies under the umbrella of one national plan.	
Waste Prevention Programme for England 2013	This Programme sets out the government's view of the key roles and actions which should be taken to move towards a more resource efficient economy. As well as describing the actions the government is taking to support this move, it also highlights actions businesses, the wider public sector, the civil society and consumers can take to benefit from preventing waste.	Ensure that waste minimisation and resource efficiency are included as an Objective within the SEA.
Resource Security Action Plan 2012	This document was developed in response to private sector concerns about the availability of some raw materials. It details how the government recognises these issues, provides a framework for business action to address resource risks, and sets out a high level actions to build on the developing partnership between government and businesses to address resource concerns.	Ensure that waste minimisation and resource efficiency are included as an Objective within the SEA.
Waste (England and Wales) Regulations 2011	These regulations implement the revised EU Waste Framework Directive 2008/98 which sets requirements for the collection, transport, recovery and disposal of waste. It outlines that it is a requirement for businesses to confirm that they have applied the waste management hierarchy when transferring waste and include a declaration to this effect on their waste transfer note or consignment note. The regulations apply to businesses that: • Produce waste • Import or export waste • Carry or transport waste • Keep or store waste • Treat waste • Dispose of waste • Operate as waste brokers or dealers	Ensure that waste minimisation and resource efficiency are included as an Objective within the SEA.
Environment Act 1995	The Environment Act 1995 updates much of the earlier legislation on the areas that it extends to. The Act comprises: • Part 1 the Environment Agency and the Scottish Environmental Protection Agency, • Part II Contaminated Land and Abandoned Mines, • Part III National Parks • Part IV Air Quality, • Part V Miscellaneous, General and Supplemental Provisions (e.g. waste, mineral planning permissions, hedgerows, drainage, fisheries etc.).	Ensure that a range of environmental objectives such as air quality protection are considered in relation to the DWMP.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Noise Policy Statement for England 2010	The objectives of the Noise Policy Statement for England (NPSE) sets out three noise levels to be defined by the noise assessor: These are as follows: • NOEL – No Observed Effect Level. This is the level below which no effect can be detected. Below this level there is no detectable effect on health and quality of life due to noise. • LOAEL – Lowest Observed Adverse Effect Level. This is the level above which adverse effects on health and quality of life can be detected. • SOAEL – Significant Observed Adverse Effect Level – This is the level above which significant adverse effects on health and quality of life can occur. The NPSE considers that the noise levels above the SOAEL would be seen to have, by definition, significant adverse effects and would be considered unacceptable. Where the assessed noise levels fall between the LOAEL and the SOAEL noise levels the policy statement requires that: “all reasonable steps should be taken to mitigate and minimise adverse effects on health and quality of life while also taking into account the guiding principles of sustainable development. This does not mean that such adverse effects cannot occur but that efforts should be focused on minimising such effects” Where noise levels are below the LOAEL it is considered there will be no adverse effect. Once the noise levels are below the NOEL there will be no observable change. For the present guidance a numerical definition of LOAEL is given by the WHO Guidelines for Community Noise and BS8233:2014 Guidance on Sound Insulation and Noise Reduction for Buildings.	Ensure that the health and well-being of people is addressed through an objective in the SEA framework and that noise issues are considered.
Environmental Noise Regulations 2006	The European Environmental Noise Directive (END) is implemented in England by The Environmental Noise (England) Regulations 2006 and seeks to manage the impact of environmental noise through strategic noise mapping and the preparation and implementation of noise Action Plans. Under these regulations, the second round of strategic noise mapping has been undertaken and updated Noise Action Plans have been prepared.	Ensure that the health and well-being of people is addressed through an objective in the SEA framework and that noise issues are considered.
Air Quality Standards Regulations 2010	These regulations sets legally binding limits for concentrations in outdoor air of major air pollutants that impact public health such as particulate matter (PM10 and PM2.5) and nitrogen dioxide (NO2). As well as having direct effects, these pollutants can combine in the atmosphere to form ozone, a harmful air pollutant (and potent greenhouse gas) which can be transported great distances by weather systems. It also incorporates the 4th air quality daughter directive that sets targets for levels in outdoor air of certain toxic heavy metals and polycyclic aromatic hydrocarbons.	Ensure the inclusion of an air quality objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Air Quality Strategy for England, Scotland, Wales and Northern Ireland 2007	This Air Quality Strategy sets out air quality objectives and policy options to further improve air quality in the UK from today into the long term. As well as direct benefits to public health, these options are intended to provide important benefits to quality of life and help to protect our environment.	Ensure the inclusion of an air quality objective within the SEA framework.
Clean Air Strategy, 2019	The Clean Air Strategy explains how the UK Government will tackle all sources of air pollution, sets out policy direction, and outlines measures that will drive the move to zero emission transport modes. The strategy links into other national level policies, outlining the same targets and strategies across multiple documents. The strategy includes numerous aims and goals, many drawn from other policy documents, that are collated in brief in the executive summary. These are framed in the following topics: • protecting the nation's health; • protecting the environment; • securing clean growth and innovation; • action to reduce emissions from transport; • action to reduce emissions at home; • action to reduce emissions from farming; • action to reduce emissions from industry; and • leadership at all levels. The Clean Air Strategy effectively summarises government policy with an impact on air quality from multiple different areas. Multiple government initiatives are listed where action has been taken by central government. Of particular importance, and reinforced by the Clean Air Strategy, is the adoption of challenging and enforceable local Air Quality Strategies.	Ensure the inclusion of an air quality objective within the SEA framework.
Air Quality Plan for Nitrogen Dioxide in the UK, 2017	Jointly produced by the DfT and DEFRA, this national plan determines an approach for areas with the worst levels of traffic-related air pollution to mitigate the effects. It sets out the framework for Clean Air Zones, allowing for targeted action to improve air quality in the "shortest possible time" as required by legal obligations to meet NO2 concentration thresholds. The document also sets out plans for ending the sale of new, conventional petrol and diesel cars and vans by 2040. The plan argues that NO2 accumulation is a local issue, as the pollutants do not disperse widely like greenhouse gasses. In line with this local approach, the plan sets out support to local authorities, including: • setting up a £255 million Implementation Fund; • establishing a Clean Air Fund; and • providing £100m for retrofitting and new low emission buses.	Ensure the inclusion of an air quality objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	The plan outlines the introduction of several new funding streams that local authorities can utilise to finance measures to reduce NO2 emissions.	
UK National Ecosystem Assessment Follow-on (2014)	The UK NEA (2011) advanced a 'settings' or place-based approach to cultural ecosystem services (CES). This approach highlighted a range of cultural goods and benefits associated with peoples' interactions with the natural environment. The UK NEAFO refines and elaborates this approach. It understands CES as both the environmental spaces (e.g. parks and beaches) within which people interact with the natural environment and the cultural practices (e.g. exercising and playing) that define these interactions and spaces. More generally these environmental spaces and practices are understood to shape and reflect a wider set of cultural (collective or shared) values about ecosystems.	Ensure that the issue of protection and enhancement of biodiversity and ecosystems is addressed through an Objective in the SEA framework.
National Infrastructure Delivery Plan 2016–2021, Infrastructure and Projects Authority (HM Government) (2016)	The Plan brings together the government's plans for economic infrastructure over the next 5 years with those to support delivery of housing and social infrastructure. This is reflected by the government's commitment to invest over £100 billion by 2020-21, alongside significant ongoing private sector investment in infrastructure. This investment will drive wider economic benefits, including: • supporting growth and creating jobs in the short term as projects are built – especially where public investment is used to attract private investment • raising the productive capacity of the economy in the long term as the benefits of new infrastructure are felt; reduced transaction costs; larger and more integrated labour and product markets; and better opportunities to collaborate and innovate • driving efficiency – enabling greater specialisation and economies of scale • boosting international competitiveness – attracting inward investment and enabling trade with foreign partners	SEA needs to consider potential for cumulative effects with other developments.
Planning (Listed Buildings and Conservation Areas) Act 1990	Governs special controls in respect of buildings and areas of special architectural or historic interest. Any alteration, extension or demolition of a listed building in a way that affects its character as a building of special interest requires Listed Building Consent.	Ensure historic environment objective within SEA framework.
Strategic Environmental Assessment, Sustainability Appraisal, Historic Environment (2016)	The purpose of the advice note is to support all those involved in assessing the effects of certain plans on the historic environment. It offers advice on heritage considerations during the Sustainability Appraisal and Strategic Environmental Assessment process, and on implementing historic environment legislation, the relevant policy in the National Planning Policy Framework (NPPF) and the related guidance given in the Planning Practice Guidance (PPG) as well as the Marine Policy Statement.	Ensure historic environment objective within SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Environmental Assessment of Plans and Programmes Regulations 2004	The Regulations transpose the Directive on the assessment of the effects of certain plans and programmes on the environment (SEA Directive) into UK legislation.	Informative only.
Climate Change and the Historic Environment, English Heritage (2008)	This statement, which updates and replaces the 2006 position paper, sets out English Heritage thinking on the implications of climate change for the historic environment. It is intended both for the heritage sector and also for those involved in the wider scientific and technical aspects of climate change; in the development of strategies and plans relating to climate change impacts; or in projects relating to risk assessment, adaptation and mitigation.	Ensure that climate change resilience and the historic environment is addressed within the SEA framework through the inclusion of an appropriate objective.
The Ancient Monuments and Archaeological Areas Act 1979	Under the Act a monument which has been scheduled is protected against any disturbance including unlicensed metal detecting. Permission must be obtained for any work which might affect a monument above or below ground. English Heritage gives advice to the Government on each application. In assessing an application the Secretary of State will try to ensure any works on protected sites are beneficial to the site or are essential for its long term sustainability.	Ensure historic environment objective within SEA framework.
The Setting of Heritage Assets, Historic Environment Good Practice Advice in Planning 3 (2017)	The document sets out guidance, against the background of the National Planning Policy Framework (NPPF) and the related guidance given in the Planning Practice Guide (PPG), on managing change within the settings of heritage assets, including archaeological remains and historic buildings, sites, areas, and landscapes.	Ensure protection of historic environment objective within SEA framework.
Landscape Character Framework	This is a project that aims to map and describe the diverse landscape of England at a regional scale. It develops the idea of a landscape as a framework leading to better management of the environment. Key components are: - Regional landscape character and associated descriptions. The key characteristics of each landscape type are described under 'physical landscape', 'biodiversity', 'historic character' and 'perceptual landscape' headings. - Regional landscape character and associated descriptions. - Physical landscape UNITS and associated geology, landform, ground type and land cover information upon which the landscape types and areas mapping and descriptions are based.	Ensure protection and enhancement of landscapes is considered as an Objective within the SEA.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Safeguarding our Soils: A strategy for England, Defra (2009)	The purpose of this strategy is to highlight the areas in which soil will be prioritised and to focus attention on tackling degradation threats. The vision of this paper is to try and ensure that by 2030, all England's soils will be managed sustainably and depredation threats tackled successfully and that this will improve the quality of England's soils and safeguard their ability to provide essential services for future generations. Key topics include • Better protection for agricultural soils • Protecting and enhancing stores of soil carbon • Building the resilience of soils to a changing climate • Preventing soil pollution • Future research and monitoring	Ensure that protection of soil resources is included as an objective within the SEA framework
Our Waste, Our Resources: A Strategy for England, HM Government (2018)	The strategy sets out the plan to double resource productivity and eliminate avoidable waste of all kinds (including plastic waste) by 2050. It sets out how England will: • preserve our stock of material resources by minimising waste, promoting resource efficiency and moving towards a circular economy • minimise the damage caused to our natural environment by reducing and managing waste safely and carefully • deal with waste crime	Ensure that the issue of the prudent use of natural resources and waste reduction are considered in the SEA framework through an Objective.
Water Resources Act 1991	This Act aims to prevent and minimise pollution of water. The policing of this act is the responsibility of the Environment Agency. Under the act it is an offence to cause or knowingly permit any poisonous, noxious or polluting material, or any solid waste to enter any controlled water. Silt and soil from eroded areas are included in the definition of polluting material. If eroded soil is found to be polluting a water body or watercourse, the Environment Agency may prevent or clear up the pollution, and recover the damages from the landowner or responsible person	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.
Water Act 2003 (as amended)	The four broad aims of the Act are: • the sustainable use of water resources; • strengthening the voice of consumers; • a measured increase in competition; and • the promotion of water conservation.	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
Water Industry Act 1991	The Act sets out the main powers and duties of the water and sewerage companies, and replaces those set out in the Water Act 1989, and defined the powers of the Director General of Water Services (now the Water Services Regulation Authority (Ofwat)).	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.
Water for Life White Paper, Defra (2011)	The White Paper describes a vision for future water management in which the water sector is resilient, in which water companies are more efficient and customer focused and in which water is valued as the precious resource it is. And it explains that we all have a part to play in the realisation of this vision.	Ensure that protection of water resources is included as an objective within the SEA framework
Preparing for a drier future: England's water infrastructure needs, National Infrastructure Commission (2018)	This document sets out the National Infrastructure Commission's advice on how to address England's water supply challenges and deliver the appropriate level of resilience for the long term. The Commission's central finding is that government should ensure increased drought resilience in England by enhancing the capacity of the water supply system. This will require a twin-track approach combining demand management (including leakage reduction) with long-term investment in supply infrastructure. To achieve this, the Commission recommends that government ensure plans are in place to deliver additional supply and demand reduction of at least 4,000 million litres per day (Ml/day).	Ensure that protection of water resources is included as an objective within the SEA framework
Draft National Policy Statement for Water Resources Infrastructure, Defra (2018)	The NPS sets out the need and government's policies for, development of nationally significant infrastructure projects (NSIPs) for water resources in England. The objectives of this NPS are as follows: • To provide a clear national planning policy that facilitates the examination and determination of applications for NSIPs for water resources in England; • To set out the need for nationally significant water resources infrastructure and the role of WRMPs in identifying and satisfying the need. This will provide clarity and confidence on eligible NSIP schemes to inform water company's long term plans; • To provide the primary basis for examination by the Examining Authority and for decisions by the Secretary of State on development consent applications for water resources infrastructure; • To provide guidance to potential NSIP developers on the relevant infrastructure, generic impacts and general siting considerations that may need to be taken into account when planning for the development of water resources infrastructure; • To provide policy and guidance on generic impacts to support any relevant local planning authorities in preparing their local impact reports, which they will be invited to prepare under section 60 of the Planning Act;	Ensure that protection of water resources is included as an objective within the SEA framework

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	To guide the development of NSIPs that support the government's sustainability goals and objective to enhance the environment	
The Water Environment (WFD) (England and Wales) Regulations 2003 (as amended)	The Regulations transpose the Water Framework Directive (2000/60/EC) into UK legislation. The regulations impose duties on the Secretary of State, Welsh Ministers, the Environment Agency (EA) and Natural Resources Wales (NRW) to carry out certain functions so as to ensure compliance with the EU directives, in particular when deciding whether to grant, vary or revoke certain permits and licences which affect water quality. River basin management plans must be established for each river basin district	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework
Flood Risk Regulations 2009	The Regulations identify and take action in areas with the most significant flood risks. The purpose of the Act is to: - Introduce the concept of flood risk management and the framework for the delivery of flood and coastal erosion risk management through national and local strategies - Provide new definitions, for example "flood", "surface runoff", "Risk Management Authorities", Lead Local Flood Authority" - Establish the roles and responsibilities of the different risk management authorities	Ensure that flood and coastal erosion risk is included as an objective within the SEA framework.
Flood and Water Management Act 2010	This act provides for a better, more comprehensive management of flood risk for people, homes and businesses, helps safeguard community groups from unaffordable rises in surface water drainage charges and protects water supplies to the consumer. The key concepts include: - Flood and Coastal Erosion Risk Management - Strategies for Natural flood and coastal erosion - The establishment of regional flood and coastal communities.	Ensure that flood risk and coastal erosion risk is included as an objective within the SEA framework.
River Basin Management Plans	These plans set out how organizations, stakeholders and communities will work together to improve the water environment. A RBD covers an entire river system, including river, lake, groundwater, estuarine and coastal water bodies and are designed to protect and improve the quality of the water environment.	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.
The Environment Agency's approach to groundwater protection, Environment Agency (2018)	It contains position statements which provide information about the Environment Agency's approach to managing and protecting groundwater. They detail how the Environment Agency delivers government policy for groundwater and adopts a risk-based approach where legislation allows.	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	The primary aim of all of the position statements is the prevention of pollution of groundwater and protection of it as a resource. Groundwater protection is long term, so these principles and position statements aim to protect and enhance this valuable resource for future generations.	
The Water Resources Management Plan Regulations 2007	The Regulations prescribe how water resources management plans should be prepared and published in accordance with section 37 of the Water Industry Act.	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.
Strategic Environmental Assessment and Habitats Regulations Assessment - Guidance for Water Resources Management Plans and Drought Plans	The guidance sets out methods designed to facilitate a consistent approach across the industry, while helping to ensure regulatory compliance. The guidance reviews SEAs and HRAs of plans produced during PR09 and clarifies emerging issues, including potential double counting of impacts, the role of SEA and how its outcomes should be integrated into plans; and the application of HRA at the plan as opposed to project level.	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.
Understanding the risks, empowering communities, building resilience: The National Flood and Coastal Erosion Risk Management Strategy for England, Defra and Environment Agency (2014)	This strategy builds on existing approaches to flood and coastal risk management and promotes the use of a wide range of measures to manage risk. Risk should be managed in a co-ordinated way within catchments and along the coast and balance the needs of communities, the economy and the environment. This strategy will form the framework within which communities have a greater role in local risk management decisions and sets out the Environment Agency's strategic overview role in flood and coastal erosion risk management. The overall aim of the strategy is to ensure the risk of flooding and coastal erosion is properly managed by using the full range of options in a co-ordinated way.	Ensure that flood risk and coastal erosion risk is included as an objective within the SEA framework.
Water Resources Long-Term Planning Framework (2015-2065) (2016)	The Framework is the first study to look at the picture for public water supply in England and Wales and consider the combined impacts of the challenges of climate change, population growth and the need to reduce abstractions to protect the environment. It takes a longer term (50 years) perspective than current water resource management plans and develops new modelling of droughts, climate change impacts, and the resilience of supplies. It assesses England and Wales' long-term water needs and the options available for meeting them.	Ensure that the issue of water quality protection and enhancement is included as an Objective within the SEA framework.
National Flood and Coastal Erosion Risk Management Strategy for England (2020)	The Strategy describes what needs to be done by all risk management authorities involved in flood and coastal erosion risk management for the benefit of people and places. The Strategy seeks to better manage the risks and consequences of flooding from rivers, the sea, groundwater, reservoirs, ordinary	Ensure that flood risk and coastal erosion risk is included as an objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	watercourses, surface water and sewers and coastal erosion Its vision is 'A nation ready for, and resilient to, flooding and coastal change – today, tomorrow and to the year 2100'.	
National Policy Statement for Wastewater (2012)	The NPS sets out Government policy for the provision of major waste water infrastructure. It will be used as the primary basis for deciding development consent applications for waste water developments that fall within the definition of Nationally Significant Infrastructure Projects.	Ensure that protection of water resources is included as an objective within the SEA framework
Water Supply (Water Quality) Regulations 2016 (as amended)	The Regulations apply to water companies whose areas of supply are wholly or mainly in England including areas supplied by those companies that are in Wales. They are primarily concerned with the quality of water supplied in England by water undertakers and licensed water suppliers for domestic or food production purposes and with arrangements for the publication of information about water quality.	Ensure that protection of water resources is included as an objective within the SEA framework
Climate change approaches in water resources planning – Overview of new methods, Environment Agency (2013)	The aim of the project was to examine how climate change has been built into water resource management plans (WRMPs) to date, and to recommend best and appropriate practice for the future. This report provides a synthesis of the research completed on the project, including the main research findings, case studies of the application of UKCP09 and new methods and high-level guidelines.	Ensure that climate change resilience and protection of water resources is included as an objective within the SEA framework
UK Marine Policy Statement (2011)	This Marine Policy Statement (MPS) is the framework for preparing Marine Plans and taking decisions affecting the marine environment. The MPS will facilitate and support the formulation of Marine Plans, ensuring that marine resources are used in a sustainable way in line with the high level marine objectives and thereby: • Promote sustainable economic development; • Enable the UK's move towards a low-carbon economy, in order to mitigate the causes of climate change and ocean acidification and adapt to their effects; • Ensure a sustainable marine environment which promotes healthy, functioning marine ecosystems and protects marine habitats, species and our heritage assets; and • Contribute to the societal benefits of the marine area, including the sustainable use of marine resources to address local social and economic issues	Ensure that protection of marine environments is included as an objective within the SEA framework.
Future Water: The Government's water strategy for England, Defra (2008)	The strategy sets out how Defra want the water sector to look by 2030, and some of the steps needed to get there. Defra's vision for water policy and management is one where, by 2030 at the latest, they'll have:	Ensure that flood risk, coastal erosion risk, protection of water quality and reducing emissions of GHG's are included as an

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	- improved the quality of our water environment and the ecology which it supports, and continued to provide high levels of drinking water quality from our taps; - sustainably managed risks from flooding and coastal erosion, with greater understanding and more effective management of surface water; - ensured a sustainable use of water resources, and implemented fair, affordable and cost reflective water charges; - cut greenhouse gas emissions; and - embedded continuous adaptation to climate change and other pressures across the water industry and water users	objective within the SEA framework.
Marine Plans (Marine Management Organisation)	A marine plan: - sets out priorities and directions for future development within the plan area - informs sustainable use of marine resources - helps marine users understand the best locations for their activities, including where new developments may be appropriate. Each of the 11 marine plan areas will have a marine plan with a long-term (20 years) view of activities and will be reviewed every 3 years. There will be 10 marine plans as the North West will have a single plan following requests to have a single process and one plan for these areas.	Ensure that protection of marine environments is included as an objective within the SEA framework.
Water Resources Planning Guideline, Environment Agency (2016)	This guideline is relevant to water companies in England and Wales and to those producing regional plans.	Ensure that protection of water resources is included as an objective within the SEA framework
REGIONAL / LOCAL		
Local Development Plans	Local Development Plans are the main framework for planning in local authorities. The Plans include policies on key elements - transport, carbon reduction, employment and economic development, the natural environment and housing, etc. The following local authorities fall within the boundary and the Local Plans are relevant: Swindon, Luton, Bracknell Forest, West Berkshire, Reading, Slough, Windsor and Maidenhead, Wokingham, Wiltshire, Central Bedfordshire, Aylesbury Vale, Chiltern, South Bucks, Wycombe, Brentwood, Epping Forest, Harlow, Uttlesford, Cotswold, Basingstoke and Deane, East Hampshire, Hart, Rushmoor, Broxbourne, Dacorum, Hertsmere, North Hertfordshire, Three Rivers, Watford, Dartford, Sevenoaks, Daventry, South Northamptonshire, Cherwell, Oxford, South Oxfordshire, Vale	Ensure that issues such as carbon reduction, biodiversity, waste reduction and managing natural resources sustainably are addressed via the SEA.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	of White Horse, West Oxfordshire, Elmbridge, Epsom and Ewell, Guildford, Mole Valley, Reigate and Banstead, Runnymede, Spelthorne, Surrey Heath, Tandridge, Waverley, Woking, Stratford-on-Avon, Chichester, Crawley, Horsham, Mid Sussex, St Albans, Welwyn Hatfield, East Hertfordshire, Stevenage, City of London, Barking and Dagenham, Barnet, Bexley, Brent, Bromley, Camden, Croydon, Ealing, Enfield, Greenwich, Hackney, Hammersmith and Fulham, Haringey, Harrow, Havering, Hillingdon, Hounslow, Islington, Kensington and Chelsea, Kingston upon Thames, Lambeth, Lewisham, Merton, Newham, Redbridge, Richmond upon Thames, Southwark, Sutton, Tower Hamlets, Waltham Forest, Wandsworth and Westminster.	
River Basin Management Plans (RBMPs), Defra and Environment Agency (2015)	RBMPs set out to provide a strategic framework for managing, protecting and improving the water environment. Due to the nature of water and land resources being so closely connected, RBMP's also informs decisions on land-use planning	Ensure that flood risk and coastal erosion risk is included as an objective within the SEA framework.
Catchment Flood Management Plans (CFMPs), Defra and Environment Agency (2016)	Catchment Flood Management Plans assess all types of inland flooding from rivers, surface water, groundwater and tidal flooding across England and Wales. They do not cover coastal flooding, directly from the sea, which are covered by Shoreline Management Plans. CFMPs are to establish flood risk management policies to assist and deliver sustainable flood risk management for the long term. CFMPs should be used to inform planning and decision making by key stakeholders such as the Environment Agency, regional planning bodies and local authorities, Internal Drainage Boards, water companies and other utilities; transportation planners; landowners, farmers and land managers; and the public and businesses. The CFMPs identify six policy options for flood risk management: • Policy 1- Areas of little or no flood risk where we will continue to monitor and advise. • Policy 2 - Areas of low to moderate flood risk where we can generally reduce existing flood risk management actions. • Policy 3 - Areas of low to moderate flood risk where we are generally managing existing flood risk effectively. • Policy 4 - Areas of low, moderate or high flood risk where we are already managing the flood risk effectively but where we may need to take further actions to keep pace with climate change. • Policy 5 - Areas of moderate to high flood risk where we can generally take further action to reduce flood risk. • Policy 6 - Areas of low to moderate flood risk where we will take action with others to store water or manage run-off in locations that provide overall flood risk reduction or environmental benefits.	Ensure that flood and coastal erosion risk is included as an objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	To select the most appropriate policy, the Catchment Flood Management Plans consider how the social, economic and environmental objectives are affected by flood risk management activities under each policy option.	
Shoreline Management Plans (SMP's)	Shoreline Management Plans are developed by Coastal Groups with members mainly from local councils and the Environment Agency. SMP's cover the whole of the coastline and identify the most sustainable approach to managing the flood and coastal erosion risks to the coastline in the short-term (0 to 20 years), medium term (20 to 50 years) and long term (50 to 100 years).	Ensure that flood risk and coastal erosion risk is included as an objective within the SEA framework.
Catchment Abstraction Management Strategies (CAMS)	The Catchment Abstraction Management Strategy set out how the Environment Agency (EA) will manage water abstraction. The EA is required to ensure there is enough water for people including public, industry and agricultural water supplies. It controls the volume of water taken through a permitting system and grants new licences, where required, and regulated existence licenses. CAMS is a standard approach to assess the amount of water available for further abstraction licensing, taking into account what the environment needs. Each CAMS provides an overview of the catchment area and characteristics, including abstractions, geology, hydrology, hydrometry, water quality and discharges, ecology and conservation, recreation and navigation. The CAMS make information on water resources and licensing practice publicly available and allow the balance between the needs of abstractors, other water users and the aquatic environment to be considered in consultation with the local community and interested parties. CAMS are also the mechanism for managing time limited licences by determining whether they should be renewed and, if so, on what terms.	Ensure that protection of water resources is included as an objective within the SEA framework.
Landscape Character Assessment (LCA)	Landscape Character Assessments is the process of identifying and describing variation in character of the landscape. LCA documents identify the elements and features that make landscapes distinctive by mapping and describing character types and areas.	Ensure that protection of landscape is included as an objective within the SEA framework
Site Improvement Plans for Natura 2000 sites: London & South East, Natural England	Site Improvement Plans (SIPs) have been developed for each Natura 2000 (Special Protected Areas and Special Conservation Areas) site in England. The plans provide an overview of both the current and predicted issues affecting the condition of the site features and sets priority measures required to improve the condition. The SIPs are not legal documents, they are live documents that will be updated to reflect changes in our evidence/knowledge and as actions get underway. In the London and South East region there are 57 SIPs.	Ensure that protection of Natura 2000 sites is included as an objective within the SEA framework

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
National Character Areas (NCAs)	NCAs are subdivisions in England based on a combination of landscape, biodiversity, geodiversity and economic activity characteristics. They intend to inform local decision making for the natural environment	Ensure that protection of landscape is included as an objective within the SEA framework
AONB Management Plans	Areas of Outstanding Natural Beauty (AONB) are protected to conserve and enhance their natural beauty and distinctiveness. AONB Management Plans highlights the importance and significance of each AONBs special qualities, it presents an integrated vision for the future of each AONB, set policies to help secure the vision, states the condition of each AONB and identifies what needs to be done to achieve these outcomes.	Ensure that protection of landscape is included as an objective within the SEA framework
National Park Management Plans	All National Parks are expected to have a Management Plan for their area, to help guide the work of those with responsibilities or an interest in the Park. Government guidance emphasises that the plan should be for the National Park as a place, and not specifically for the National Park Authority or any other particular organisation. However, relevant authorities are required to take the two national park purposes into account in any work that may affect the area (Environment Act, 1995).	Ensure that protection of landscape is included as an objective within the SEA framework
WATER COMPANIES – Thames Water		
Thames Water's Sustainability Policy	There are nine key themes within the Sustainability Policy: • Protecting water, a precious resource. • Managing wastewater and sustainable drainage. • Mitigating climate change. • Adapting to climate change. • Delivering efficient operations. • Investing sustainably for the long-term. • Ensuring responsible operations. • Enhancing customer inclusion. • Maintaining a safe and sustainable workforce.	Ensure that protection of water resources and climate change resilience are included as an objective within the SEA framework.
Thames Water Environment Policy	The main approach set out by the Environment Policy is to strike the right balance between delivering services to customers and managing business responsibly, whilst maintaining the environmental impact. The policy has 10 core outcomes, which are to: • Comply with all applicable environmental laws and regulations;	Ensure that protection of water resources, reduction of carbon emissions and biodiversity are included as

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	• Compliance with environmental permit requirements; • Complete all schemes necessary to meet new environmental regulations; • Work closely with external regulatory bodies to ensure emerging environmental obligations are addressed appropriately; • Protect and enhance biodiversity; • Continued maintenance of networks and treatment works; • Sustainably manage water resources; • Adopt a catchment based approach to planning and delivering our water and wastewater services; • Manage carbon emissions through optimisation and innovation of current and new processes; and • Aim to be a socially responsible business working in partnership with a wide range of stakeholders across the region.	an objective within the SEA framework
WRMP 2020 to 2100 (2019)	The Plan sets out the actions to be taken to provide a secure and sustainable supply of water for Thames Water customers in London and the Thames Valley over the next 80 years. This is essential for everyday life, the wellbeing of the environment and economic growth. It is designed to satisfy three main objectives: • To provide a secure supply of water for our customers addressing the supply demand deficits that we forecast in our region • To improve resilience to a severe drought • To look beyond the needs and opportunities of our supply area alone and take into account the growing needs of the wider south east of England. In developing our plan, we have worked with neighbouring companies in the south east of England to ensure an effective and efficient outcome for customers across the region	Ensure that protection of water resources is included as an objective within the SEA framework.
Drought Plan (2017)	This document has been produced in line with the Drought Plan Regulations 2005 and the guidelines provided by the Environment Agency (EA). Both the Drought Plan and WRMP are based on the following principles: • The need to maintain security of supply for our customers. • The level of restrictions imposed on customers is commensurate with the Company's Levels of Service (LoS).	Ensure that protection of water resources is included as an objective within the SEA framework.

Plan, Policy or Legislation	Key Objectives / Targets / Guidance	Implications for the PEAR
	A fundamental assumption in Thames Water's Drought Plan is that the risk to Levels of Service is minimal when all Water Resources Zones (WRZ) are in supply demand balance. The balance between supply and demand has been reviewed for all our WRZs within the Water Resources Management Plan, July 2014.	
Building a better future – Business Plan 2020 to 2025	The Plans strategic priorities are; • Deliver brilliant customer engagement to create lifelong advocacy; • Invest in resilient systems and assets; • Use data from customers, operations and the environment to make better decisions; • Build a collaborative and capable team, dedicated to serving our customers; and • Protect and enhance the environment.	Ensure that protection of water resources and biodiversity are included as an objective within the SEA framework.

Appendix C. Impact Magnitude Proformas

Table 2.1 – Impact Magnitude Proforma: GSO B1.1 Source control SuDS measures

GSO	B1.1 Source control SuDS measures This GSO is assumed to be the surface water component of solution C4.0			
Description	Installation of surface water management devices to collect, store and infiltrate surface water from buildings and surrounding impermeable areas such as driveways and car parks. This option includes residential properties, schools and other public buildings, commercial and industrial buildings. Installation of surface water management devices to collect, store and infiltrate surface water from roads, pavements and pedestrianised areas.			
Typical Construction Impacts	Most source control components will be located within the private properties or highway areas. Their purpose is to manage rainfall close to where it falls, not allowing it to become a problem elsewhere. Source control measures can include: • Green roofs • Rainwater harvesting • Permeable paving • Other permeable surfaces SuDS construction usually requires the use of fairly standard civil engineering construction and landscaping operations, such as excavation, filling, grading, topsoiling, seeding and planting. Pollution and sediment control is a key consideration during construction as construction runoff can be heavily laden with silt, which can clog infiltration systems, build up in storage systems and pollute receiving waters ¹¹³ .			
Typical Mitigation	Design • Locate at distance from sensitive receptors • Consider potential for ecological enhancement • Consider compensatory green infrastructure	Construction • Integration of Construction Environmental Management Plan • Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations • Appropriate management of invasive species	Operation • Regular programme of maintenance and monitoring to ensure operation at most efficient level	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Minor improvement to, or addition of, one or more key characteristics, features or elements of biodiversity resource, its function, capacity and / or connectivity may be expected as a result of SuDS Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Creation of SuDS expected to result in improvement in public understanding and engender connections with the natural environment Adverse Very minor adverse, limited to construction.	Medium	Low

¹¹³ <https://www.susdrain.org/delivering-suds/using-suds/delivery/construction.html>

Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Creation of SuDS expected to result in minor improvement to human health and well-being improvements where there is an increase in green infrastructure and reduced flood risk. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of SuDS expected to result in minor improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of SuDS expected to result in improvements to waterbodies including reducing sediment loading Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To reduce and manage flood risk	Beneficial Creation of SuDS expected to result in improvement through alleviating capacity pressures on drainage network and receiving waters during storm events. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Minor improvements may be anticipated where SuDS reduces risk of soil erosion Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where SuDS improves resilience to flooding events Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. SuDS may also act to improve amenity of townscapes through green roofs and other interventions. Adverse	Low	Low

		Short to medium-term loss or damage, though reversible, may be expected through construction		

Table 11 - Impact Magnitude Proforma: GSO B1.2 Targeted source control SuDS measures at major opportunity areas

GSO	B1.2 Targeted source control SuDS measures at major opportunity areas			
Description	Delivery of large-scale surface water management strategies across the catchment's opportunity areas to significantly reduce the total flow entering the sewer network at these locations.			
Typical Construction Impacts	It is anticipated that large scale surface water management may involve the development of tanks, ponds or other structures to store water on a temporary basis. Development of such infrastructure could result in large scale civil engineering activities.			
Typical Mitigation	Design • Locate at distance from sensitive receptors • Consider potential for ecological enhancement • Consider compensatory green infrastructure • Careful site selection – avoid areas of better quality soils if possible and target previously used land • Sustainable design measures	Construction • Integration of Construction Environmental Management Plan • Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations • Appropriate management of invasive species • Care of topsoil for future reuse • Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction • Consideration of waste hierarchy and Use of recycled or re-used materials in a Site Waste Management Plan (SWMP)	Operation • Regular programme of maintenance and monitoring to ensure operation at most efficient level • Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Minor improvement to, or addition of, one or more key characteristics, features or elements of biodiversity resource, its function, capacity and / or connectivity may be expected as a result of SuDS Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Creation of SuDS expected to result in improvement in public understanding and engender connections with the natural environment Adverse Short to medium-term loss or damage, though reversible, may be expected through construction.	Medium	Medium
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Creation of SuDS expected to result in improvement to human health and well-being improvements where there is an increase in green infrastructure and reduced flood risk. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low

Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Large scale creation of SuDS expected to result in moderate improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Medium
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of SuDS expected to result in improvements to waterbodies including reducing sediment loading Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To reduce and manage flood risk	Beneficial Creation of large scale SuDS expected to result in improvement through alleviating capacity pressures on drainage network and receiving waters during storm Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Minor improvements may be anticipated where SuDS reduces risk of soil erosion Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Significant improvements may be anticipated where large scale SuDS improves resilience to flooding events Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. SuDS may also act to improve amenity of townscapes through, for example, use of SuDS ponds and other interventions. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Medium

Table 12 - Impact Magnitude Proforma: GSO B2.1 Combined sewer separation. Convert existing combined sewers to surface water only and construct new foul water sewers.

GSO	B2.1 Combined sewer separation (1). Convert existing combined sewers to surface water only and construct new foul water sewers.			
Description	Progressively convert existing combined sewer networks into surface water networks by constructing a parallel foul sewer network (gravity, vacuum or pressurised).			
Typical Construction Impacts	Complete separation of a combined sewer would involve the disconnection of all storm water drainage structures, sump pumps, and roof and footer drains. This may require extensive construction works and result in construction related impacts including from noise, dust, erosion, disruption to residents and businesses as well as disruptions in sewer services ¹¹⁴ .			
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection – avoid areas of better quality soils if possible and target previously used land	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Appropriate management of invasive species - Care of topsoil for future reuse - Use of best practice construction techniques to minimise annoyance and nuisance during construction, e.g. in relation to noise. This should be addressed in a CEMP - Adherence to all relevant health and safety measures	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reduced instances of out of sewer flooding and sewer overflows into receiving watercourses has the potential to have significant beneficial effect on biodiversity and ecological function. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reduced instances of out of sewer flooding and sewer overflows into receiving watercourses has the potential to improve amenity value of watercourses, increasing connection between people and nature. Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Medium
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Alleviating capacity pressures on waste water networks and resources through the separation of foul water and surface water. Adverse	High	Low

¹¹⁴ <https://www3.epa.gov/npdes/pubs/sepa.pdf>

		Short to medium-term loss or damage, though reversible, may be expected through construction		
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Separation of foul water and surface water will reduce pressure on waste water networks and reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of reduced pressure on waste water networks. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where resilience to flooding events is improved through reduced pressure on waste water networks Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 13 - Impact Magnitude Proforma: GSO B2.3 Disconnect existing surface water systems from combined sewers & discharge to watercourse

GSO	B2.3 Disconnect existing surface water systems from combined sewers & discharge to watercourse
Description	Progressively disconnect surface water sewers from existing combined sewer networks and direct discharge to suitable receptors (gravity, vacuum or pressurised).
Typical Construction Impacts	Although there would be limited construction, as it involves existing sewers, works would still need to be carried out in order to disconnect the existing sewers, install vacuum or pressurised systems (e.g. pumping stations). Where works are carried out and water is discharged there is the potential for biodiversity to be impacted where there are existing

	species and habitats. Impacts may also be realised with respect to soil and water among others.			
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection – avoid areas of better quality soils if possible and target previously used land - Sustainable design measures	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Care of topsoil for future reuse - Consideration of water quality and pollution in Construction Environmental Management Plans (CEMPs).	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reduced potential for overflows from combined systems anticipated to result in significant benefits for receiving watercourses, biodiversity and ecological functions. Adverse Potential for existing species and habitats to be lost or damaged where works are carried out and water is discharged	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reduced instances of out of sewer flooding and sewer overflows into receiving watercourses has the potential to improve amenity value of watercourses, increasing connection between people and nature. Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Alleviating capacity pressures on waste water networks and resources through the separation of foul water and surface water. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Separation of foul water and surface water will reduce pressure on waste water networks and reduce instances of overflows into receiving watercourses Adverse Potential for existing watercourses to be negatively affected by the increased discharge of surface waters containing contaminants from urban runoff.	Medium	Medium
	To reduce and manage flood risk	Beneficial	Medium	Low

		Reduced instances of out of sewer flooding expected as a result of reduced pressure on waste water networks. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction		
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where resilience to flooding events is improved through reduced pressure on waste water networks Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 14 - Impact Magnitude Proforma: GSO B2.4 Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s)

GSO	B2.4 Deep tunnel(s) to connect surface water networks to major reuse or discharge location(s)		
Description	Deep tunnel network to capture SW flows from major strategic sink points across the city and convey it to a major reuse or discharge location. Assumed that this approach would only be used where natural surface level pathways are insufficient.		
Typical Construction Impacts	Deep tunnel systems are generally 10-foot (3-meter) or larger in diameter ¹¹⁵ . Therefore, the construction works would be likely to cause significant impacts across a range of environmental and population topics such as Biodiversity, population and human health, material assets and water, among others, are likely to be impacted.		
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection – avoid areas of better quality soils if	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary

	possible and target previously used land Sustainable design measures	Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Care of topsoil for future reuse - Consideration of waste hierarchy and Use of recycled or re-used materials in a Site Waste Management Plan (SWMP)		
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial The reduced potential for overflows from combined systems during storm events as a result of capture of surface water anticipated to result in significant benefits to biodiversity Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reduced instances of out of sewer flooding and sewer overflows into receiving watercourses has the potential to improve amenity value of watercourses, increasing connection between people and nature. Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of flooding expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Deep tunnels expected to result in significant improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, with the potential to be permanent, may be expected through construction and operation	High	Medium
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Increased capacity for surface water will reduce contribution of surface water to combined systems and reduce out of sewer flooding Adverse Short to medium-term loss or damage, with the potential to be permanent (e.g. groundwater systems) may be expected through construction and operation	Medium	Low
	To reduce and manage flood risk	Beneficial Reduced instances of flooding expected as a result of surface water capacity increases. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	High

Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Significant improvements may be anticipated where increased capacity of surface water network improves resilience to flooding events Adverse Magnitude of impact negligible	High	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets. Detailed design and investigation may afford opportunity to identify previously unknown heritage features Adverse Loss or damage, with the potential to be permanent may be expected through construction	Medium	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 15 - Impact Magnitude Proforma: GSO B2.5 Combined sewer separation. Convert existing combined sewers to foul water only and convey surface water on the surface using SuDS measures.

GSO	B2.5 Combined sewer separation. Convert existing combined sewers to foul water only and convey surface water on the surface using SuDS measures.			
Description	Fully above ground system (highways, swales, channels etc.) collecting highway and building flows and conveying to local watercourse or re-use point.			
Typical Construction Impacts	Although there would be limited construction, as it involves existing sewers, works would still need to be carried out in order to convert the existing sewers. Where surface water is conveyed on the surface there is the potential for biodiversity to be impacted where there are existing species and habitats. Impacts may also be realised with respect to soil and water among others.			
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Improvement to, or addition of, one or more key characteristics, features or elements of biodiversity resource, its function, capacity and / or connectivity may be expected as a result of SuDS.	High	Medium

		The reduced potential for overflows from combined systems during storm events also anticipated to result in significant benefits to biodiversity Adverse Potential for existing species and habitats to be lost or damaged where water is conveyed on the surface using channels		
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Creation of SuDS expected to result in improvement in public understanding and engender connections with the natural environment Adverse Short to medium-term loss or damage, with the potential to be permanent, may be expected through construction, reducing during operation as new habitats and species become established	Medium	Low
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Creation of SuDS expected to result in improvement to human health and well-being improvements where there is an increase in green infrastructure and reduced flood risk. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Removal of surface water flows from combined systems and creation of SuDS expected to result in significant improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, with the potential to be permanent, may be expected through construction and operation	Medium	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Removal of surface water flows from combined systems reducing overflows and creation of SuDS are expected to result in significant improvements to waterbodies Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Removal of surface water flows from combined systems reduces potential for out of sewer flooding and SuDS anticipated to reduce pressure on networks during peak storm events. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Minor improvements may be anticipated where SuDS reduces risk of soil erosion Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low

	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where SuDS and combined sewer separation improves resilience to flooding events, particularly out of sewer flooding Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. SuDS may also act to improve amenity of townscapes. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 16 - Impact Magnitude Proforma: GSO B2.6 Re-create historical rivers to convey surface water

GSO	B2.6 Re-create historical rivers to convey surface water		
Description	As per description – this option would require activities to open up the lost watercourse and the conveyance infrastructure to get the surface water to the water course.		
Typical Construction Impacts	Depending on the condition of the historical watercourse, its banks and any matured habitats, re-creating a river to convey surface water has the potential to involve significant construction activities, including dredging, clearance of scrub and habitats, modifications to watercourses and habitats and will therefore impact on material assets, noise, biodiversity, water as well as issues of cultural heritage.		
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Consideration of character, setting, level of protection and potential need for conservation during planning and design - Consideration of opportunities for enhancement of known features of industrial & cultural heritage significance	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction - Consideration of water quality and pollution in Construction Environmental Management Plans (CEMPs).	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary

		• Precautions for unexpected heritage discovery during construction • Consideration of unexpected heritage discovery in Construction Environmental Management Plans (CEMPs)		
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Recreation of historical watercourses would provide a potential habitat for wildlife Adverse Existing habitats are likely to be lost or damaged through construction, depending on the significance of the construction activities required. Effects would be anticipated to reduce as new habitat and species become established	Medium	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Recreation of historical watercourses would provide a potential habitat for wildlife and create an attractive open space for people to enjoy. Option also presents significant opportunity to demonstrate biodiversity value and value of natural systems to convey surface water Adverse Existing habitats are likely to be lost or damaged through construction, with potential consequences on connections between people and nature. Effects would be anticipated to reduce as new habitats become established and a 'sense of place' is restored/created.	High	Low
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Investment in historical rivers, providing new habitat and a recreational asset for the local population expected to result in significant benefits for human health and well-being. Adverse Existing habitats are likely to be lost or damaged through construction, with potential consequences on connections between people and nature. Effects would be anticipated to reduce as new habitats become established and a 'sense of place' is restored/created.	High	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Recreation of historical rivers expected to result in significant improvement through reuse. Capacity pressures on waste water networks and resources would also be anticipated to be reduced. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Recreation of historical rivers is expected to result in significant improvements in river water quality. Reduced pressure on sewers as a result of capture of surface flows has the potential to reduce instances of combined overflows into receiving watercourses Adverse	High	Medium

		Short to medium-term loss or damage, though reversible, may be expected through construction		
	To reduce and manage flood risk	Beneficial Significant capacity improvements as a result of recreation of historic rivers. Reduced risk of out of sewer flooding expected as pressure on waste water systems is decreased. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Restoration of historic rivers promotes a catchment-wide approach to land management with the potential to alleviate need for designating flood areas upstream. Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size and condition of historic river.	Medium	Low
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Recreation of historic rivers may act to promote alternative travel, including the use of adjacent tow paths as cycleways/walkways encouraging a modal shift from traditional forms of transport. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where resilience to flooding events is improved Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets. The historic river and associated features may themselves be heritage assets that would benefit from restoration Adverse Loss or damage, with the potential to be permanent may be expected through construction	Medium	Medium
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Recreation of historic rivers may provide a recreational asset and provide the means to explore landscape and the countryside Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Medium

Table 17 - Impact Magnitude Proforma: GSO B2.7 Use parks and urban spaces to store excess surface water during rainfall events

GSO	B2.7 Use parks and urban spaces to store excess surface water during rainfall events

Description	Daylight surface water systems through parks to create a water-based public amenity with a well-defined flood plain to be used for exceedance events and/or allow surface water systems running through/under urban social spaces to flood (during extreme events) into a well-defined sacrificial storage area within the urban space. Could involve daylighting some or all of the surface water flow path but keep buried if more appropriate.			
Typical Construction Impacts	Where existing parks and urban spaces must be modified to capture and temporarily store excess surface waters, this has the potential to impact on the accessibility, function and capacity of the park or urban space to perform its original service. Impacts may therefore be realised with respect to Population and human health, material assets and water among others.			
Typical Mitigation	Design • Locate at distance from sensitive receptors • Consider potential for ecological enhancement • Consider compensatory green infrastructure • Ensure option is designed to latest H&S standards • Careful site selection - avoid areas of better quality soils if possible and target previously used land	Construction • Integration of Construction Environmental Management Plan • Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations • Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) • Appropriate management of invasive species • Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction • Use of best practice construction techniques to minimise annoyance and nuisance during construction, e.g. in relation to noise. This should be addressed in a CEMP • Adherence to all relevant health and safety measures • Care of topsoil for future reuse • Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs)	Operation • Regular programme of maintenance and monitoring to ensure operation at most efficient level • Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Significant opportunity to improve existing or create additional riverine/wetland or other habitat within parks Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Significant opportunity to improve existing or create additional riverine habitat within parks with knock on benefits for public amenity and education Adverse Magnitude of impact negligible	Medium	Negligible

Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Significant opportunity to create of water-based public amenity space and reduce instances of flooding Adverse Short to medium-term loss or damage, may be expected through construction	High	Medium
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of storage expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of storage capacity will reduce instances of overflows from sewers into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Creation of dedicated flooding areas and reduced instances of out of sewer flooding expected as a result of storage capacity increases for surface water. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Creation of dedicated flooding areas for surface water promotes a catchment wide approach to land management Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Medium	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where dedicated storage of flood water improves resilience to flooding events Adverse Magnitude of impact negligible	High	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 18 - Impact Magnitude Proforma: GSO B3.0 Property-level protection measures to prevent buildings from flooding

GSO	B3.0 Property-level protection measures to prevent buildings from flooding			
Description	Provide vulnerable homes with passive flood protection measures such as flood proof doors and/or provide vulnerable homes with active property flood resilience measures such as self-sealing bath/shower systems (non-return valves). Active measures could also include the installation of FLIPs devices. Temporary raised barriers erected in response to flood predictors in order to create a flow retention storage volume to avoid damage to property. Increase thresholds of commercial properties to protect from more severe floods (future-proof). Develop and build partnerships with strategic asset owners and operators to provide resilient flood protection measures. Develop and build partnerships with property developers, product suppliers and the insurance industry to provide a framework for offering high quality affordable property flood protection measures.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Typical Mitigation	Design Community engagement throughout the process	Construction Community engagement throughout the process	Operation Regular programme of maintenance and monitoring to ensure operation at most efficient level	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Minor benefits to human health associated with increased resilience to property flooding including out of sewer flooding. Adverse Magnitude of impact considered negligible	Low	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Protection of properties will reduce the risk of loss and damage to property and possessions Adverse Magnitude of impact considered negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To reduce and manage flood risk	Beneficial Whilst the intervention does not reduce flood risk, benefits may be	Medium	Negligible

		associated with the resilience afforded by the solution to flood prone areas Adverse Magnitude of impact considered negligible		
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Benefits associated with the resilience afforded by the solution to flood prone areas Adverse Magnitude of impact considered negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Benefits associated with the resilience afforded by the solution to flood prone areas which may contain heritage assets, for example, Listed Buildings. Adverse Magnitude of impact considered negligible	Medium	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 19 - Impact Magnitude Proforma: GSO C1.0 "Intelligent" sewer network to control flows

GSO	C1.0 "Intelligent" sewer network to control flows			
Description	Active System Management (ASM) at key points in the network to optimise available network capacity by balancing network flows. E.g. Automation of weir chambers on trunk sewers. Requires deployment of sewer monitors for live/predictive modelling. Active system management at key pumping stations across the network to optimise available network capacity by balancing network flows. Requires deployment of sewer monitors for live/predictive modelling. Ability to monitor and control flow at pipe/chamber level. Integrate energy and cost monitoring from operational sites into active system management decision-making process.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.

Table 21 - Impact Magnitude Proforma: GSO C3.1 Increase network capacity by installing larger sewers

GSO	C3.1 Increase network capacity by installing larger sewers			
Description	Replace existing sewers in most beneficial locations with larger sewers to increase network capacity.			
Typical Construction Impacts	The construction impact is likely to be relatively extensive and intrusive. Impacts may therefore be realised with respect to biodiversity, population and human health, material assets and water among others. Increasing capacity may help to reduce flood risk.			
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection - avoid areas of better quality soils if possible and target previously used land - Consideration of opportunities for enhancement of known features of industrial & cultural heritage significance	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction - Care of topsoil for future reuse - Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs) - Precautions for unexpected heritage discovery during construction - Consideration of unexpected heritage discovery in Construction Environmental Management Plans (CEMPs)	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reducing or eliminating out of sewer flooding and overflows into receiving watercourses has the potential to have significant benefits to biodiversity Adverse	High	Medium

		Short to medium-term loss or damage, though reversible, may be expected through construction		
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reducing or eliminating out of sewer flooding and overflows into receiving watercourses has the potential to have significant benefits to biodiversity and strengthen connections between people and nature e.g. through making watercourses more attractive recreational and amenity spaces Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvements to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of increased capacity expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage to existing below ground infrastructure may be expected through construction	Medium	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Increased capacity will help to reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of network capacity increases. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage to soil resources, may be expected through construction though magnitude dependant on size	Negligible	High
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where increased capacity improves resilience to flooding events Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Medium

Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Medium

Table 22 - Impact Magnitude Proforma: GSO C3.2 Deep tunnel(s) to convey combined sewage

GSO	C3.2 Deep tunnel(s) to convey combined sewage			
Description	Deep tunnels to convey combined sewage to treatment location. Creates conveyance capacity for storm water.			
Typical Construction Impacts	The construction impact is likely to be relatively extensive and intrusive with the removal of large volumes of soils, trenching, watercourse modifications etc and associated noise and air quality impacts. Impacts anticipated in respect of biodiversity, population and human health, material assets and water among others.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Increased capacity in network will reduce spills into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of storage expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of storage capacity will reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of storage capacity increases. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	High
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where storage improves	Medium	Negligible

		resilience to flooding events within combined networks Adverse Magnitude of impact negligible		
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Medium
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Medium

Table 24– Impact Magnitude Proforma: GSO C5.0 Sewer lining to target infiltration hotspots

GSO	C5.0 Sewer lining to target infiltration hotspots			
Description	Programme of sewer and manhole lining in areas of high infiltration and high potential benefit.			
Typical Construction Impacts	Although there would be limited construction, as it involves existing sewers, works would still need to be carried out in order to line the existing sewers. There is the potential for biodiversity and water, among others, to be impacted.			
Typical Mitigation	Design N/A	Construction - Integration of Construction Environmental Management Plan - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs)	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Reducing infiltration will act to increase efficiency of wastewater networks and alleviate capacity constraints Adverse Magnitude of impact considered negligible	High	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To reduce and manage flood risk	Beneficial	Medium	Negligible

		Potential to alleviate out of sewer flooding where capacity pressures from infiltration is reduced Adverse Magnitude of impact considered negligible		
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Reduced risk of flooding by alleviating infiltration related capacity pressures on drainage and wastewater networks Adverse Magnitude of impact considered negligible	Low	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 25 - Impact Magnitude Proforma: GSO C6.0 Transfer flow between catchments via existing connections

GSO	C6.0 Transfer flow between catchments via existing connections			
Description	Connections exist between the catchments and also between some of the STWs. These connections could be used to transfer flows between catchments without capacity to those with short term capacity.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Typical Mitigation	Design N/A	Construction N/A	Operation Regular programme of maintenance and monitoring to ensure operation at most efficient level	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Managing pressures on capacity through transfers would reduce potential for overflows into receiving watercourses. Adverse Magnitude of impact considered negligible	Medium	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Managing pressures on capacity through transfers would reduce potential for overflows into receiving watercourses therefore making	Low	Negligible

		watercourses more attractive places for recreation and amenity. Adverse Magnitude of impact considered negligible		
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvement to human health and well-being. Adverse Magnitude of impact considered negligible	Low	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Improved efficiency of wider infrastructure in making better use of resource availability. Adverse Magnitude of impact considered negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Managing pressures on capacity through transfers would reduce potential for overflows into receiving watercourses. Adverse Magnitude of impact considered negligible	Medium	Negligible
	To reduce and manage flood risk	Beneficial Potential to alleviate risk of flooding where capacity pressures are reduced by transfer flows between catchments Adverse Magnitude of impact considered negligible	Medium	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Reduced risk of flooding by alleviating capacity pressures on drainage and wastewater networks by transfer flows between catchments Adverse Magnitude of impact considered negligible	Low	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 26 - Impact Magnitude Proforma: GSO C7.0 Transfer flow between catchments via new connections

GSO	C7.0 Transfer flow between catchments via new connections
Description	This option is about creating new connections between the STW catchments to optimise capacities and to find the best balance of flow and load i.e. removing catchment boundaries. It would allow utilisation of the short term capacity in some STWs whilst other STWs are expanded or redeveloped.

	Similar to the London Water Ring Main this could be a large infrastructure project that would allow most/all catchments to discharge into a single infrastructure pipe/tunnel and then allow any or all of the STWs to extract from this ring main and treat the flows. Reliant on availability of suitable STWs - London may be the only possible location for such a strategic option			
Typical Construction Impacts	The construction impact is likely to be extensive and intrusive. Impacts may therefore be realised with respect to biodiversity, population and human health, material assets and water among others.			
Typical Mitigation	Design • Locate at distance from sensitive receptors • Consider potential for ecological enhancement • Consider compensatory green infrastructure • Careful site selection - avoid areas of better quality soils if possible and target previously used land • Consideration of opportunities for enhancement of known features of industrial & cultural heritage significance	Construction • Integration of Construction Environmental Management Plan • Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations • Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) • Appropriate management of invasive species • Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscape are maintained as far as practical during construction • Care of topsoil for future reuse • Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs) • Precautions for unexpected heritage discovery during construction • Consideration of unexpected heritage discovery in Construction Environmental Management Plans (CEMPs)	Operation • Regular programme of maintenance and monitoring to ensure operation at most efficient level • Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Managing pressures on capacity through transfers would reduce potential for overflows into receiving watercourses. Adverse Short to medium-term loss or damage, may be expected through construction	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Managing pressures on capacity through transfers would reduce potential for overflows into receiving watercourses therefore making watercourses more attractive places for recreation and amenity. Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvement to human health and well-being. Adverse	Medium	Low

		Short to medium-term loss or damage, though reversible, may be expected through construction		
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Improved efficiency of wider infrastructure in making better use of resource availability. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Managing pressures on capacity through transfers would reduce potential for overflows into receiving watercourses. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Potential to alleviate risk of flooding where capacity pressures are reduced by transfer flows between catchments Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage to soil resources as a result of new connections between catchments.	Negligible	High
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Reduced risk of flooding by alleviating capacity pressures on drainage and wastewater networks by transfer flows between catchments Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Ground investigation presents opportunity for discovery of previously unknown heritage features Adverse Loss or damage, with the potential to be permanent may be expected through construction	Medium	Medium
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Reduced potential for flooding has the potential to protect and enhance townscapes and countryside Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Medium

Table 27 - Impact Magnitude Proforma: GSO C9.0 Intercompany wastewater transfers

GSO	C9.0 Intercompany wastewater transfers
Description	This option would be about transferring sewage effluent from catchments within the TW operating area to STWs in neighbouring water and waste companies that may have spare capacity.
Typical Construction Impacts	It is assumed that intercompany wastewater transfers are achieved via lorry movements/tankers and therefore no construction impacts anticipated.

Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvement to human health and well-being. Adverse Magnitude of impact considered negligible	Low	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To reduce and manage flood risk	Beneficial Potential to alleviate risk of flooding where capacity pressures are reduced by transfer flows between catchments Adverse Magnitude of impact considered negligible	Low	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Where conventional lorry/tanker movements required to undertake transfers this has the potential to increase pressure on air quality.	Negligible	Medium
	To adapt and improve resilience to the threats of climate change	Beneficial Reduced risk of flooding by alleviating capacity pressures on drainage and wastewater networks by transfer flows between catchments Adverse Magnitude of impact considered negligible	Low	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 28 - Impact Magnitude Proforma: GSO D1.2 Remove Fats, Oils and Grease (FOG) in the network

GSO	D1.2 Remove Fats, Oils and Grease (FOG) in the network			
Description	Removing FOG in the network would result in less blockages and optimal use of sewer capacity. For removal in the catchment then technology such as Dissolved Air Flotation (DAFs) could be used to remove grease. This would require additional storage tanks in the network.			
Typical Construction Impacts	In relation to the construction impacts from a maintenance team there is nothing of note, but greater impacts may be associated with the potential use of Dissolved Air Flotation and the associated land take from storage tanks. Impacts may therefore be realised with respect to biodiversity, material assets and water among others.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Less blockages would likely reduce potential for out of sewer flooding and overflows into receiving watercourses Adverse Magnitude of impact negligible	Low	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding due to a reduction in blockages, expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Reduced blockages ensure most efficient use of sewer capacity Adverse Magnitude of impact negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of storage and optimal use of sewer capacity will reduce instances of overflows into receiving watercourses Adverse Magnitude of impact negligible	Low	Negligible
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of storage capacity increases and optimal use of sewer capacity. Adverse Magnitude of impact negligible	Low	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where storage and optimal use of sewer capacity improves resilience to flooding events Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact negligible Adverse	Negligible	Negligible

		Magnitude of impact negligible		
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Magnitude of impact negligible	Low	Negligible

Table 29 - Impact Magnitude Proforma: GSO D2.2 Real Time Control Implementation (including SCADA upgrades)

GSO	D2.2 Real Time Control Implementation (including SCADA upgrades)			
Description	Real Time Control (RTC) is about managing and controlling the works based on the actual flows and loads arriving at the site rather than on a set profile. This could be on secondary treatment plant, sludge thickening or even in reaction to rainfall radar and smart sewer sensors that allow the works to prepare for high flows by dropping the sludge blankets, desludging primary settlement tanks or changing DO targets.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Potential to reduce frequency of overflows with consequent benefits to receiving watercourses/biodiversity Adverse Magnitude of impact considered negligible	Low	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Potential to reduce frequency of equipment related failures driving out of sewer flooding benefiting human health and well-being Adverse Magnitude of impact considered negligible	Low	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Real time and better management controls will act to increase efficiency of wastewater networks Adverse Magnitude of impact considered negligible	High	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Potential to reduce frequency of equipment related failure overflows into receiving watercourses Adverse Magnitude of impact considered negligible	Low	Negligible
	To reduce and manage flood risk	Beneficial Better understanding of network capacity through RTC should improve capacity to react to flood events. Adverse Magnitude of impact considered negligible	Medium	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse	Negligible	Negligible

		Magnitude of impact considered negligible		
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Better understanding of network capacities and resources through RTC should afford greater resilience to threats of climate change, specifically flooding events. Adverse Magnitude of impact considered negligible	Low	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 30 - Impact Magnitude Proforma: GSO D3.0 Replace/retrofit/expand existing primary/secondary treatment processes with more intensive processes

GSO	D3.0 Replace/retrofit/expand existing primary/secondary treatment processes with more intensive processes		
Description	Chemically Assisted Primary Sedimentation (CAPS), Dissolved Air Flotation, Lamellas, and sand ballasted primary treatment are some of the 5+ methods of getting more intensive Primary treatment from a smaller area of land than traditional processes. There are a range of different technologies that have been identified for increasing the intensity of secondary treatment processes at the STW either with retrofitting or new build e.g. modular stacked treatment processes.		
Typical Construction Impacts	The replacement or expansion of existing primary/secondary treatment processes is likely to require significant construction works however, with the exception of expansions, these will largely be confined to the existing treatment works footprint. Less significant impacts are anticipated from retrofitting existing primary/secondary due to the level of construction involved.		
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection - avoid areas of better quality soils if possible and target previously used land	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Care of topsoil for future reuse - Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs)	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary

Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Improved water quality and reduced instances of overflows likely to improve biodiversity in receiving watercourses Adverse Short to medium-term loss or damage, with the potential to be permanent (where land take is required), may be expected through construction	Medium	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reduced instances of overflows at treatment works and/or improved quality of discharges into receiving watercourses expected to result in improved biodiversity and consequent value for local people Adverse Magnitude of impact negligible	Low	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of overflows at treatment works and/or improved quality of discharges expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Improvement/expansion of treatment works expected to result in significant efficiency benefits. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Improvement/expansion of treatment works expected to reduce instances of spills into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To reduce and manage flood risk	Beneficial Reduced instances of flooding expected as a result of expanded treatment works/capacity improvements Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where improved resilience to flooding events occurs due to expanded treatment works Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact is negligible Adverse	Negligible	Low

		Loss or damage, with the potential to be permanent may be expected through construction		
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, with the potential to be permanent (where land take is required), may be expected through construction	Negligible	Low

Table 31 - Impact Magnitude Proforma: GSO D4.1 Buy land and expand STW (Effluent and sludge treatment)

GSO	D4.1 Buy land and expand STW (Effluent and sludge treatment)			
Description	Buy land and expand STW (Effluent and sludge treatment)			
Typical Construction Impacts	The construction impact of expanding STW is likely to be extensive. Impacts may be realised with respect to biodiversity, air, soil, population and human health, material assets and water among others.			
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection - avoid areas of better quality soils if possible and target previously used land - Consideration of potential opportunities for landscape enhancement	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Care of topsoil for future reuse - Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs) - Use of best practice construction techniques to minimise annoyance and nuisance during construction, e.g. in relation to noise. This should be addressed in a CEMP - Adherence to all relevant health and safety measures - Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Expansion of treatment works will reduce instances of overspills into receiving watercourses during storm events therefore improving biodiversity Adverse Construction on new land is likely to result in permanent loss or damage to biodiversity	High	High
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Expansion of treatment works will reduce instances of overspills into receiving watercourses during storm events therefore improving biodiversity	Low	Low

		and strengthen connections between people and nature Adverse Construction on new land is likely to result in permanent loss or damage to biodiversity. Where this is on land that was previously used by the public this may adversely impact upon connections between people and nature		
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of flooding as result of greater capacity expected to result in improvement to human health and well-being. Adverse Expansion on to new land may adversely impact on local amenities such as open space and loss or damage would be irreversible	Medium	Medium
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of storage expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of greater treatment capacity will reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of treatment capacity increases. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Improvements may be anticipated where greater treatment capacity improves resilience to flooding events Adverse Magnitude of impact negligible	High	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets. Ground investigations during design may afford opportunities for discovery of previously unknown heritage features Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and	Beneficial Where reduced flood risk is anticipated, this may indirectly afford	Low	Medium

	undesigned landscapes, townscapes and the countryside	greater protection to townscapes, landscape and the countryside. Adverse Permanent loss or damage to landscape where expansion is undertaken		

Table 32 - Impact Magnitude Proforma: GSO D4.2 Buy land and move sludge treatment to new location. Expand effluent stream on remaining land.

GSO	D4.2 Buy land and move sludge treatment to new location. Expand effluent stream on remaining land.			
Description	Buy land and move sludge treatment to new location. Expand effluent stream on remaining land.			
Typical Construction Impacts	The construction impact is likely to be extensive. Impacts may be realised with respect to biodiversity, air, soil, landscape, population and human health, material assets and water among others.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Expansion of network/treatment capacity will reduce instances of overflows into receiving watercourses during storm events therefore improving biodiversity Adverse Construction on new land is likely to result in permanent loss or damage to biodiversity	High	High
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Expansion of treatment/network capacity will reduce instances of overflows into receiving watercourses during storm events therefore improving biodiversity and strengthen connections between people and nature Adverse Construction on new land is likely to result in permanent loss or damage to biodiversity. Where this is on land that was previously used by the public this may adversely impact upon connections between people and nature	Low	Low
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of flooding as result of greater capacity expected to result in improvement to human health and well-being. Adverse Expansion on to new land may affect amenities and loss or damage would be irreversible	Medium	Medium
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of storage expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of greater treatment capacity will reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low

	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of treatment capacity increases. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Improvements may be anticipated where greater treatment capacity improves resilience to flooding events Adverse Magnitude of impact negligible	High	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets. Ground investigations during design may afford opportunities for discovery of previously unknown heritage features Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Permanent loss or damage to landscape in a new location	Low	High

Table 33 - Impact Magnitude Proforma: GSO D5.0 Construct new/additional STW

GSO	D5.0 Construct new/additional STW		
Description	Option involves construction of new treatment works within the catchment (meeting either single or multiple catchment needs) - effective decentralisation of treatment. Increased centralisation of STWs with decommissioning of those considered as surplus to requirement.		
Typical Construction Impacts	Wide range of construction impacts in order to deliver new/addition STW. Impacts may be realised across a range of environmental and societal issues such as biodiversity, air, soil, landscape, population and human health and water among others.		
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection - avoid areas of better quality soils if	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary

	possible and target previously used land	Construction Environmental Management Plans (CEMPs) • Appropriate management of invasive species • Use of best practice construction techniques to minimise annoyance and nuisance during construction, e.g. in relation to noise. This should be addressed in a CEMP • Adherence to all relevant health and safety measures • Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction • Care of topsoil for future reuse • Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs)		
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Expansion of network/treatment capacity will reduce instances of overflows into receiving watercourses during storm events therefore improving biodiversity Adverse Construction on new land is likely to result in permanent loss or damage to biodiversity	High	High
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Expansion of treatment/network capacity will reduce instances of overflows into receiving watercourses during storm events therefore improving biodiversity and strengthen connections between people and nature Adverse Construction on new land is likely to result in permanent loss or damage to biodiversity. Where this is on land that was previously used by the public this may adversely impact upon connections between people and nature	Low	Medium
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of flooding as result of greater capacity expected to result in improvement to human health and well-being. Adverse Expansion on to new land may affect amenities and loss or damage would be irreversible	Medium	Medium
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of storage expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial	High	Low

		Creation of greater treatment capacity will reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction		
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of treatment capacity increases. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Improvements may be anticipated where greater treatment capacity improves resilience to flooding events Adverse Magnitude of impact negligible	High	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets. Ground investigations during design may afford opportunities for discovery of previously unknown heritage features Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Permanent loss or damage to landscape in a new location	Low	High

Table 34 - Impact Magnitude Proforma: GSO D8.1 Real-time quality monitoring and dynamic consenting

GSO	D8.1 Real-time quality monitoring and dynamic consenting			
Description	Real-time effluent and receiving water quality monitoring to improve statistical confidence, reduce uncertainty and allow for dynamic consenting.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reduced potential for breaches in water quality anticipated to result in improvement in biodiversity for receiving watercourses Adverse Magnitude of impact considered negligible	Low	Negligible

	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Reduced potential for breaches in water quality anticipated to result in improvement in quality of watercourses Adverse Magnitude of impact considered negligible	Medium	Negligible
	To reduce and manage flood risk	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 35 - Impact Magnitude Proforma: GSO B2.2 Combined sewer separation. Construct new surface water sewers.

GSO	B2.2 Combined sewer separation. Construct new surface water sewers.
Description	Fully below/above ground surface water sewer network collecting different types of run off and conveying to receptor which could be a local watercourse, a major watercourse or a water reuse point.

Typical Construction Impacts	Complete separation of a combined sewer would involve the disconnection of all storm water drainage structures, sump pumps, and roof and footer drains. This may require extensive construction works and result in construction related impacts including from noise, dust, erosion, disruption to residents and businesses as well as disruptions in sewer services ¹¹⁶ .			
Typical Mitigation	Design • Locate at distance from sensitive receptors • Consider potential for ecological enhancement • Consider compensatory green infrastructure • Careful site selection - avoid areas of better quality soils if possible and target previously used land	Construction • Integration of Construction Environmental Management Plan • Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations • Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) • Appropriate management of invasive species • Use of best practice construction techniques to minimise annoyance and nuisance during construction, e.g. in relation to noise. This should be addressed in a CEMP • Adherence to all relevant health and safety measures • Care of topsoil for future reuse • Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs)	Operation • Regular programme of maintenance and monitoring to ensure operation at most efficient level • Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reduced instances of out of sewer flooding and sewer overflows into receiving watercourses has the potential to have significant beneficial effect on biodiversity and ecological function. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reduced instances of out of sewer flooding and sewer overflows into receiving watercourses has the potential to improve amenity value of watercourses, increasing connection between people and nature. Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Medium
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste,	Beneficial Alleviating capacity pressures on waste water networks and resources through the separation of foul water and surface water.	High	Low

¹¹⁶ <https://www3.epa.gov/npdes/pubs/sepa.pdf>

	encourage its re-use and eliminate waste sent to landfill	Adverse Short to medium-term loss or damage, though reversible, may be expected through construction		
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Separation of foul water and surface water will reduce pressure on waste water networks and reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of reduced pressure on waste water networks. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where resilience to flooding events is improved through reduced pressure on waste water networks Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 36 - Impact Magnitude Proforma: GSO B2.8 Use highways to store and convey surface water during rainfall events

GSO	B2.8 Use highways to store and convey surface water during rainfall events
Description	Highways designed to retain water when gullies and/or the sewer network are unable to accept any more flow and/or highways to convey exceedance flows as a secondary function when sewer network capacity is reached with further protective receptor measures to be taken at topographical low points.
Typical Construction Impacts	Where highways must be modified to capture and temporarily store excess surface waters, this has the potential to impact on the accessibility, function and capacity of the highway to perform its original service. Impacts may therefore be

	realised with respect to Population and human health, material assets and water among others.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Potential to reduce out of sewer flooding and overflows into receiving watercourses through increased surface water storage Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding through increased surface water storage expected to result in improvements to human health and well-being. Adverse Short to medium-term loss or damage, including disruptions to highways network, may be expected through construction	Low	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of storage expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of storage capacity will reduce instances of overflows from sewers into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of storage capacity increases. Adverse Magnitude of impact negligible	Medium	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where dedicated storage of flood water improves resilience to flooding events Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse	Low	Low

		Loss or damage, with the potential to be permanent may be expected through construction		
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 37 - Impact Magnitude Proforma: GSO D8.2 Real-time quality monitoring with automated process response

GSO	D8.2 Real-time quality monitoring with automated process response			
Description	Real-time / continuous effluent and receiving water quality monitoring (improves confidence / reduces uncertainty) in conjunction with automated re-treatment / selective recirculation (or diversion to emergency tertiary treatment process) of low quality effluent to maximise discharge of quality effluent. Permit criteria considers ecological sensitivity of receiving water (seasonality, specific species requirements etc.).			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reduced potential for breaches in water quality anticipated to result in improvement in biodiversity for receiving watercourses Adverse Magnitude of impact considered negligible	Low	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Automating responses will act to make more efficient the treatment process Adverse Magnitude of impact considered negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Reduced potential for breaches in water quality anticipated to result in improvement in quality of watercourses Adverse Magnitude of impact considered negligible	Medium	Negligible
	To reduce and manage flood risk	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 38 - Impact Magnitude Proforma: GSO D12.1 Sludge Transfers (cross-company, internal, from centralised STW)

GSO	D12.1 Sludge Transfers (cross-company, internal, from centralised STW)			
Description	Sludge transfers as described.			
Typical Construction Impacts	It is assumed that intercompany wastewater transfers are achieved via lorry movements/tankers and therefore no construction impacts anticipated.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Making use of available capacity between catchments anticipated to result in benefits in respect of efficiency and reduced wastes Adverse Magnitude of impact considered negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

	To reduce and manage flood risk	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Where conventional lorry/tanker movements required to undertake transfers this has the potential contribute to deterioration in air quality	Negligible	Medium
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 39 - Impact Magnitude Proforma:GSO D1.1 Screening in the network

GSO	D1.1 Screening in the network			
Description	Removing screenings in the network would result in less blockages and optimal use of sewer capacity. Less screenings arriving at STW would reduce the risk of screens being overwhelmed on the site resulting in out of service plant thus increasing the sites resilience. Technology such as coarse or fine screens could be used. Skips and odour control would be required.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Less blockages would likely reduce potential for out of sewer flooding and overflows into receiving watercourses Adverse Magnitude of impact negligible	Low	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding due to a reduction in blockages, expected to result in improvement to human health and well-being. Adverse Magnitude of impact negligible	Medium	Negligible

Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Reduced blockages ensure most efficient use of sewer capacity Adverse Magnitude of impact negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Optimal use of sewer capacity will reduce instances of overflows into receiving watercourses Adverse Magnitude of impact negligible	Low	Negligible
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of optimal use of sewer capacity. Adverse Magnitude of impact negligible	Low	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where optimal use of sewer capacity improves resilience to flooding events Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Magnitude of impact negligible	Low	Negligible

Table 40 - Impact Magnitude Proforma: GSO D1.3 Primary settlement in the network

GSO	D1.3 Primary settlement in the network			
Description	Primary treatment in the network would reduce the requirement for similar capacity at STW. This would only be possible where the volume of settled flow can subsequently be diverted directly to secondary treatment. Compact technology with associated sludge holding tanks could be located near major pumping stations.			
Typical Construction Impacts	Requirement for new infrastructure such as sludge holding tanks and pipe network to transfer directly to secondary treatment is likely to require intrusive construction with associated impacts on biodiversity, material assets, soils and water among others.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Increased capacity in the network would reduce potential for out of sewer flooding and overspills into receiving watercourses Adverse Construction of sludge tanks has the potential to result in short to medium-term loss or damage, though reversible.	Medium	Medium

	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Increased capacity in the network would reduce potential for out of sewer flooding and overflows into receiving watercourses, increasing value of rivers as places for recreation Adverse Magnitude of impact negligible	Low	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Increased capacity in the network would reduce potential for out of sewer flooding and therefore improve human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Increased capacity in the network and reduction in pressures on existing primary treatment within treatment works. Adverse Magnitude of impact negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of storage will reduce instances of overflows into receiving watercourses Adverse Magnitude of impact negligible	Low	Negligible
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of storage capacity increases and optimal use of sewer capacity. Adverse Magnitude of impact negligible	Medium	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse While localised, permanent loss and/or damage to soil resources where sludge tanks are constructed	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where storage capacity increased results in an improved resilience to flooding events Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Ground investigations present opportunity for discovery of previously unknown heritage features that can then be recovered/protected. Adverse Potential for permanent loss or damage to heritage features during construction works	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Magnitude of impact negligible	Low	Negligible

Table 41 - Impact Magnitude Proforma: GSO D1.4 Chemical Treatment within the network (Ferric)

GSO	D1.4 Chemical Treatment within the network (Ferric)

Description	Adding Fe to the network reduces septicity and enhances primary treatment at the site. This improves the treatability of the sewage and also improves the performance of existing processes.			
Typical Construction Impacts	In relation to the construction impacts from a maintenance team there is nothing of note.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Improved treatability of the sewage and performance of treatment processes will result in better efficiency Adverse Magnitude of impact negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To reduce and manage flood risk	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible

Table 42 - Impact Magnitude Proforma: GSO D1.5 Biological treatment within the network

GSO	D1.5 Biological treatment within the network
Description	Adding return activated sludge (RAS) to a sewer system would provide additional biological treatment within the network allowing for reduced secondary treatment on site. Periodically oxygen would have to be added to continue the biological treatment. Typically, this would involve blowing air into the flow. Multiple aeration points within the network would be required.

Typical Construction Impacts	Creation of aeration points through the network not anticipated to result in significant construction impacts.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Improved efficiency of treatment plants anticipated as a result of adding RAS to sewer system Adverse Magnitude of impact negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To reduce and manage flood risk	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible

Table 43 - Impact Magnitude Proforma: GSO D1.6 Other within-sewer treatment

GSO	D1.6 Other within-sewer treatment			
Description	Within-sewer treatment options (e.g. fatberg dissolving enzymes, peroxide) to begin treatment processes in advance of sewage treatment works. Eliminates or reduces risk of blockages and corrosive by-products).			
Typical Construction Impacts	In relation to the construction impacts from a maintenance team there is nothing of note.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Less blockages would likely reduce potential for out of sewer flooding and overflows into receiving watercourses Adverse	Low	Negligible

		Magnitude of impact negligible		
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of out of sewer flooding due to a reduction in blockages, expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Reduced blockages ensure most efficient use of sewer capacity Adverse Magnitude of impact negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Optimal use of sewer capacity will reduce instances of overflows into receiving watercourses Adverse Magnitude of impact negligible	Low	Negligible
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of optimal use of sewer capacity and reduced blockages. Adverse Magnitude of impact negligible	Low	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Improvements may be anticipated where optimal use of sewer capacity improves resilience to flooding events Adverse Magnitude of impact negligible	Low	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible

Table 44 - Impact Magnitude Proforma: GSO D2.1 Optimising maintenance performance

GSO	D2.1 Optimising maintenance performance
Description	Opportunities presented by digitization are being used to offset the issues of ageing infrastructure and capacity shortfalls to meet increasing demand. Digitization can provide a better understanding of both networks and treatment processes thereby extending asset life and increasing treatment capacity. In addition, digitisation can generate “Smart Data” to make informed decisions to increase plant capacity and performance. Capital maintenance regimes can vary from a ‘fix on fail’ approach for less critical assets to a more proactive rolling replacement programme for some key assets such as aeration domes. Enhanced capital maintenance is about a strict planned rolling programme of proactive maintenance that not only ensures that the assets

	are fixed quickly when failed but likely they are maintained (e.g. oiled and greased or strengthened) to prevent failure or premature failure. Operations teams are under increasing pressure to maintain availability, throughput and consent. The increasingly tight process and control envelope, the bolstering options being considered, and the potential new process solutions mean that a successful 'in consent' works requires the operations team to be 'on board' and fully conversant with all solutions & installations. An aim from this initiative would be to facilitate a greater understanding of the impact of operational changes. The management of these STWs can involve complex biological and chemical interactions and flow management. A better understanding of the elements of the system and the use of the data available may allow the sites to be run with less headroom.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Potential to reduce frequency of equipment related failure overflows with consequent benefits to receiving watercourses Adverse Magnitude of impact considered negligible	Low	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Potential to reduce frequency of equipment related failures driving out of sewer flooding benefiting human health and well-being Adverse Magnitude of impact considered negligible	Low	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Proactive maintenance, digitisation and better management tools will act to increase efficiency of wastewater networks Adverse Magnitude of impact considered negligible	High	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Potential to reduce frequency of equipment related failure overflows into receiving watercourses Adverse Magnitude of impact considered negligible	Low	Negligible
	To reduce and manage flood risk	Beneficial Potential to reduce frequency of equipment related failure out of sewer flooding. Also better understanding of network capacity through digitisation should improve capacity to react to flood events. Adverse Magnitude of impact considered negligible	Medium	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse	Negligible	Negligible

		Magnitude of impact considered negligible		
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Better understanding of network capacities and resources through digitisation should afford greater resilience to threats of climate change, specifically flooding events. Adverse Magnitude of impact considered negligible	Low	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 45 - Impact Magnitude Proforma: GSO D7.1 River catchment-based discharge permitting

GSO D7.1 River catchment-based discharge permitting				
Description	Catchment-based discharge permitting (optimising operational and environmental headroom). Some deterioration or less stringent discharge permit criteria allowed in certain locations with conditions improved elsewhere (potentially more stringent permit criteria at certain sites). Net overall benefit.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Option implies an improvement in some locations with more stringent permit criteria which would act to reduce pressures on receiving watercourses and subsequent biodiversity Adverse While catchment based, less stringent discharge permitting criteria may increase pressures on receiving watercourses and subsequent biodiversity	Low	Low
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Option implies an improvement in some locations with more stringent permit criteria which would act to reduce pressures on receiving watercourses and increase their attractiveness as recreational spaces for local population Adverse While catchment based, less stringent discharge permitting criteria may	Low	Low

		increase pressures on receiving watercourses and reduce attractiveness as recreational spaces for local population.		
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Option implies an improvement in some locations with more stringent permit criteria which would act to reduce pressures on receiving watercourses Adverse While catchment based, less stringent discharge permitting criteria may increase pressures on receiving watercourses	Low	Low
	To reduce and manage flood risk	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 46 - Impact Magnitude Proforma: GSO D7.2 Environmental effects based permitting

GSO	D7.2 Environmental effects based permitting			
Description	Discharge permitting based on bioavailability or ecological impact rather than water quality. Reflects the fact that the relationship between water quality and ecological quality is often non-linear and difficult to predict.			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and	Beneficial Greater consideration of ecological impact specifically in permitting	Medium	Low

	habitat connectivity within water company's operating area	anticipated to result in improvements to biodiversity Adverse While understanding of bioavailability may act to improve biodiversity in receiving watercourses for some, those that are 'available' may be subject to increased pressure and deterioration in quality.		
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Greater consideration of ecological impact specifically in permitting anticipated to result in improvements to water quality owing to the interrelationship between ecological quality and water quality Adverse While understanding of bioavailability may act to improve biodiversity in receiving watercourses for some, those that are 'available' may be subject to increased pressure and deterioration in quality owing to the same interrelationship	Medium	Low
	To reduce and manage flood risk	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 47 - Impact Magnitude Proforma: GSO D7.3 Treatment process-based permitting

GSO D7.3 Treatment process-based permitting				
Description	Treatment process-based permitting where the permit requires specific treatment processes and conditions to be deployed at a site (rather than the discharge quality that should be achieved) - permit compliance determined through provision of evidence that influents have been subject to the agreed treatment processes (follows example of sludge treatment principles).			
Typical Construction Impacts	Negligible impacts anticipated due to the level of construction involved.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Dependant on the capacity of treatment process to reliably equal or better the quality derived permitting Adverse Potential for adverse effects on biodiversity where focus is taken away from the quality of discharge	Low	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Dependant on the capacity of treatment process to reliably equal or better the quality derived permitting. This will have implications on receiving watercourses, biodiversity and the enjoyment of local populations Adverse Potential for adverse effects on biodiversity where focus is taken away from the quality of discharge. This will have implications on receiving watercourses, biodiversity and the enjoyment of local populations	Low	Low
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Dependant on the capacity of treatment process to reliably equal or better the quality derived permitting. This will have implications on receiving watercourses, biodiversity and the health and well-being of local populations who enjoy these assets Adverse Potential for adverse effects on biodiversity where focus is taken away from the quality of discharge. This will have implications on receiving watercourses, biodiversity and the health and well-being of local populations who enjoy these assets	Low	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Dependant on the capacity of treatment process to reliably equal or better the quality derived permitting Adverse Potential for adverse effects on biodiversity where focus is taken away from the quality of discharge	Low	Medium
	To reduce and manage flood risk	Beneficial Magnitude of impact considered negligible Adverse	Negligible	Negligible

		Magnitude of impact considered negligible		
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 48 - Impact Magnitude Proforma: GSO D9.1 Treatment of diffuse pollution sources (inputs to river)

GSO	D9.1 Treatment of diffuse pollution sources (inputs to river)			
Description	Treat the chemical inputs to the river from sources other than STWs (e.g. from agriculture, road and trading estate run-off) in lieu of STW-based treatment options to achieve the equivalent environmental outcome.			
Typical Construction Impacts	Dependant on the method used to treat agricultural, road and trading estate run off noting however that impacts would be dispersed across many more locations up and downstream within catchments than a STW based solution. Treating slurry run off for example may require interventions across many locations.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reduced instances of pollution into receiving watercourses has the potential to have significant beneficial effect on biodiversity and ecological function. Adverse Dependant on method used to treat chemical inputs to river there could be some adverse impacts resulting from construction	High	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reduced instances of pollution into receiving watercourses has the potential to improve amenity value of watercourses, increasing connection between people and nature. Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced pressures from pollution expected to result in improvement to human health and well-being. Adverse Short to medium term loss or damage during construction may be anticipated	Medium	Low

Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Reduced pressures on treatment works expected where pressures on receiving watercourses is alleviated through upstream measures Adverse Magnitude of impact negligible	Medium	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Reduce pollution pressures on receiving watercourses Adverse Short to medium term loss or damage during construction may be anticipated	High	Low
	To reduce and manage flood risk	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Potential benefits where measures to reduce runoff also reduce sediment washing from soils Adverse Magnitude of impact negligible	Low	Negligible
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Magnitude of impact negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible

Table 49 - Impact Magnitude Proforma: GSO D9.2 Treatment of diffuse pollution sources (inputs to sewer)

GSO	D9.2 Treatment of diffuse pollution sources (inputs to sewer)			
Description	Treat chemical inputs from non-water sector sources to reduce ultimate wastewater process treatment requirement.			
Typical Construction Impacts	Dependant on the measures used to treat chemical inputs however in general expected to be negligible.			
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Reduce instances/severity of pollution into receiving watercourses Adverse Magnitude of impact negligible	Low	Negligible
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Significant efficiencies where treatment works are subject to less pressures Adverse Magnitude of impact negligible	High	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Reduce instances/severity of pollution into receiving watercourses Adverse	Medium	Negligible

		Magnitude of impact negligible		
	To reduce and manage flood risk	Beneficial Magnitude of impact negligible Adverse Magnitude of impact negligible	Negligible	Negligible

Table 52 - Impact Magnitude Proforma: Wild Card - New STW at Luxborough Lane Barking town centre surface water disconnection

GSO	New STW at Luxborough Lane Barking town centre surface water disconnection			
Description	New STW at Luxborough Lane location to treat a small proportion of flow from within the catchment. Discounted due to feasibility and lack of benefit. Barking town centre – a focused areas of removal of surface water from the combined sewer system and discharge elsewhere, thereby creating additional capacity in the existing system			
Typical Construction Impacts	Wide range of construction impacts in order to deliver new STW. Impacts may be realised across a range of environmental and societal issues such as biodiversity, air, soil, landscape, population and human health and water among others.			
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection - avoid areas of better quality soils if possible and target previously used land	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Use of best practice construction techniques to minimise annoyance and nuisance during construction, e.g. in relation to noise. This should be addressed in a CEMP - Adherence to all relevant health and safety measures - Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction - Care of topsoil for future reuse - Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs)	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Expansion of network/treatment capacity will reduce instances of overflows into receiving watercourses during storm events therefore improving biodiversity Adverse	High	High

		Construction on new land is likely to result is permanent loss or damage to biodiversity		
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Expansion of treatment/network capacity will reduce instances of overflows into receiving watercourses during storm events therefore improving biodiversity and strengthen connections between people and nature Adverse Construction on new land is likely to result is permanent loss or damage to biodiversity. Where this is on land that was previously used by the public this may adversely impact upon connections between people and nature	Low	Medium
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of flooding as result of greater capacity expected to result in improvement to human health and well-being. Adverse Expansion on to new land may affect amenities and loss or damage would be irreversible	Medium	Medium
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of storage expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Creation of greater treatment capacity will reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of treatment capacity increases. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	Medium
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low

	To adapt and improve resilience to the threats of climate change	Beneficial Improvements may be anticipated where greater treatment capacity improves resilience to flooding events Adverse Magnitude of impact negligible	High	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets. Ground investigations during design may afford opportunities for discovery of previously unknown heritage features Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Permanent loss or damage to landscape in a new location	Low	High

Table 53 - Impact Magnitude Proforma: Wild Card - Major upgrade to inlet pumping station at Hogsmill STW

GSO	Major upgrade to inlet pumping station at Hogsmill STW		
Description	On existing STW site, improvement/new pumping station to pass more flows forward to treatment from the catchment		
Typical Construction Impacts	The construction impact is likely to be relatively extensive however confined to the existing STW. Improved pumping is anticipated to result in an increased treatment capacity at Hogsmill STW.		
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection - avoid areas of better quality soils if possible and target previously used land - Consideration of opportunities for enhancement of known features of industrial & cultural heritage significance	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Use of best practice construction techniques and Construction Environmental Management Plan (CEMP) to ensure that the character and quality of landscapes and townscapes are maintained as far as practical during construction - Care of topsoil for future reuse - Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs)	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary

		• Precautions for unexpected heritage discovery during construction • Consideration of unexpected heritage discovery in Construction Environmental Management Plans (CEMPs)		
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Upgrades to pumping may result in treatment capacity increases subsequently reducing or eliminating out of sewer flooding and overflows into receiving watercourses has the potential to have significant benefits to biodiversity Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Capacity increases and subsequently reducing or eliminating out of sewer flooding and overflows into receiving watercourses has the potential to have significant benefits to biodiversity and strengthen connections between people and nature e.g. through making watercourses more attractive recreational and amenity spaces Adverse Magnitude of impact negligible	Medium	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Capacity increases and subsequently reduced instances of out of sewer flooding expected to result in improvements to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Creation of increased capacity expected to result in improvement through alleviating capacity pressures on waste water networks and resources. Adverse Short to medium-term loss or damage to existing below ground infrastructure may be expected through construction	Medium	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Increased capacity will help to reduce instances of overflows into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To reduce and manage flood risk	Beneficial Reduced instances of out of sewer flooding expected as a result of	Medium	Low

		network capacity increases/upgrades to pumping. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction		
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage to soil resources, may be expected through construction though magnitude dependant on size	Negligible	Low
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Negligible	Low
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where increased capacity improves resilience to flooding events Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to cultural heritage assets Adverse Loss or damage, with the potential to be permanent may be expected through construction	Low	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Where reduced flood risk is anticipated, this may indirectly afford greater protection to townscapes, landscape and the countryside. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Low	Low

Table 54 - Impact Magnitude Proforma: Wild Card - Iver South STW mixed liquors alternative discharge location

GSO	Iver South STW mixed liquors alternative discharge location		
Description	Discharge effluent into sewer for further treatment.		
Typical Construction Impacts	Although there would be limited construction, works may be anticipated to connect/divert discharges to existing sewers.		
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection – avoid areas of better quality soils if	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary

	possible and target previously used land Sustainable design measures	- Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Care of topsoil for future reuse - Consideration of water quality and pollution in Construction Environmental Management Plans (CEMPs).		
Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial An improvement in discharge quality would act to reduce pressures on receiving watercourses and subsequent biodiversity Adverse Potential for existing species and habitats to be lost or damaged where works are carried out and water is discharged	Low	Low
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact negligible	Negligible	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial An improvement in discharge quality would act to reduce pressures on receiving watercourses and increase their attractiveness as recreational spaces for local population Adverse Magnitude of impact negligible	Low	Negligible
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial An improvement in discharge quality would act to reduce pressures on receiving watercourses Adverse Potential for existing watercourses to be negatively affected by the increased discharge potentially containing contaminants.	Low	Low
	To reduce and manage flood risk	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact considered negligible Adverse	Negligible	Negligible

		Magnitude of impact considered negligible		
Air and Climate	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
	To adapt and improve resilience to the threats of climate change	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact considered negligible Adverse Magnitude of impact considered negligible	Negligible	Negligible

Table 55 - Impact Magnitude Proforma: Wild Card - Maple Lodge STW Catchment Grit removal and increased capacity at Maple Lodge and linked Blackbirds STWs

GSO	Maple Lodge STW Catchment Grit removal and increased capacity at Maple Lodge and linked Blackbirds STWs			
Description	There are a range of different technologies that have been identified for increasing capacity of treatment processes at the STW either with retrofitting or new build e.g. modular stacked treatment processes.			
Typical Construction Impacts	The replacement or expansion of existing primary/secondary treatment processes is likely to require significant construction works however, with the exception of expansions, these will largely be confined to the existing treatment works footprint. Less significant impacts are anticipated from retrofitting existing primary/secondary due to the level of construction involved.			
Typical Mitigation	Design - Locate at distance from sensitive receptors - Consider potential for ecological enhancement - Consider compensatory green infrastructure - Careful site selection - avoid areas of better quality soils if possible and target previously used land	Construction - Integration of Construction Environmental Management Plan - Consideration of the timing of construction works in relation to ecological windows, health and wellbeing and traffic considerations - Consideration of biodiversity and designated sites and habitats in Construction Environmental Management Plans (CEMPs) - Appropriate management of invasive species - Care of topsoil for future reuse - Consideration of contaminated spoil in Construction Environmental Management Plans (CEMPs)	Operation - Regular programme of maintenance and monitoring to ensure operation at most efficient level - Scheduled control of invasive species where necessary	

Topic	Objective	Scoring Rationale	Impact Magnitude	
			Beneficial	Adverse
Biodiversity	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	Beneficial Improved water quality and reduced instances of overflows likely to improve biodiversity in receiving watercourses Adverse Short to medium-term loss or damage, with the potential to be permanent (where land take is required), may be expected through construction	Medium	Medium
	To strengthen the connections between people and nature and realise the value of biodiversity	Beneficial Reduced instances of overflows at treatment works and/or improved quality of discharges into receiving watercourses expected to result in improvement biodiversity and consequent value for local people Adverse Magnitude of impact negligible	Low	Negligible
Population and Human health	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	Beneficial Reduced instances of overflows at treatment works and/or improved quality of discharges expected to result in improvement to human health and well-being. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Material Assets	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	Beneficial Improvement/expansion of treatment works expected to result in significant efficiency benefits. Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	High	Low
Water	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	Beneficial Improvement/expansion of treatment works expected to reduce instances of spills into receiving watercourses Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
	To reduce and manage flood risk	Beneficial Reduced instances of flooding expected as a result of expanded treatment works/capacity improvements Adverse Short to medium-term loss or damage, though reversible, may be expected through construction	Medium	Low
Soil	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	Beneficial Magnitude of impact negligible Adverse Permanent loss or damage, may be expected through construction though magnitude dependant on size	Negligible	Medium
	To reduce air pollutant and greenhouse gas emissions	Beneficial Magnitude of impact is negligible	Negligible	Low

Air and Climate		Adverse Short to medium-term loss or damage, though reversible, may be expected through construction		
	To adapt and improve resilience to the threats of climate change	Beneficial Medium improvements may be anticipated where improved resilience to flooding events occurs due to expanded treatment works Adverse Magnitude of impact negligible	Medium	Negligible
Cultural heritage	To conserve and enhance the historic environment, the heritage assets therein and their setting	Beneficial Magnitude of impact is negligible Adverse Loss or damage, with the potential to be permanent may be expected through construction	Negligible	Low
Landscape	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside	Beneficial Magnitude of impact is negligible Adverse Short to medium-term loss or damage, with the potential to be permanent (where land take is required), may be expected through construction	Negligible	Low

Appendix D. GSO Significance of Effect – All Catchments (excluding London Catchments, LRZs and existing STWs)

GSOs coloured **red** in the table below identifies those that are not being taken forward in the Final Plan for the associated catchment but had previously been briefed. Remaining solutions have been taken forward into the Final Plan. Those GSOs coloured **green** identify GSOs that were not previously briefed in the associated catchment but have now been proposed in the Final Plan.

Appendix E. GSO Significance of Effect – London Catchments and LRZs

GSOs coloured **red** in the table below identifies those that are not being taken forward Final Plan for the associated catchment but had previously been briefed. Remaining solutions have been taken forward into the Final Plan. Those GSOs coloured **green** identify GSOs that were not previously briefed in the associated catchment but have now been proposed in the Final Plan.

	DWMP Generic Sub-Option List		Score Category	Biodiversity		Population and Human health	Material Assets	Water		Soil	Air and Climate		Cultural heritage	Landscape
London Catchment / London Risk Zone	DWMP Generic Sub-Option ID	DWMP Generic Sub Option Title	Positive / Adverse	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	To strengthen the connections between people and nature and realise the value of biodiversity	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	To reduce and manage flood risk	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	To reduce air pollutant and greenhouse gas emissions	To adapt and improve resilience to the threats of climate change	To conserve and enhance the historic environment, the heritage assets therein and their setting	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside

Appendix F. GSO Significance of Effect – Existing Sewage Treatment Works

GSOs coloured **red** in the table below identifies those that are not being taken forward Final Plan for the associated catchment but had previously been briefed. Remaining solutions have been taken forward into the Final Plan. Those GSOs coloured **green** identify GSOs that were not previously briefed in the associated catchment but have now been proposed in the Final Plan.

	DWMP Generic Sub-Option List		Score Category	Biodiversity		Population and Human health	Material Assets	Water		Soil	Air and Climate		Cultural heritage	Landscap e
Catchment	DWMP Generic Sub-Option ID	DWMP Generic Sub Option Title	Positive / Adverse	To protect and enhance biodiversity, ecological functions, capacity, and habitat connectivity within water company's operating area	To strengthen the connections between people and nature and realise the value of biodiversity	To improve human health and well-being of the area, improve access to recreation and the environment, and reduce inequalities	To reduce, and make more efficient, the domestic, industrial and commercial consumption of resources, minimise the generation of waste, encourage its re-use and eliminate waste sent to landfill	To maintain or improve the quality of rivers, lakes, groundwater, estuarine and coastal waterbodies	To reduce and manage flood risk	To protect and enhance geology, the quality and quantity of soils and promote a catchment-wide approach to land management	To reduce air pollutant and greenhouse gas emissions	To adapt and improve resilience to the threats of climate change	To conserve and enhance the historic environment, the heritage assets therein and their setting	To protect, enhance the quality of, and improve access to designated and undesignated landscapes, townscapes and the countryside

This document has 719 pages including the cover.

Contents

Chapter	Page
Appendix G. All Catchments (excluding London Catchments, LRZ and existing STWs)10	
1.2. ABBESS RODING STW Catchment	11
1.3. ALDERMASTON STW Catchment	13
1.4. ABINGDON STW Catchment	15
1.5. ALDERSHOT STW Catchment	17
1.6. ALTON STW Catchment	20
1.7. AMPNEY ST PETER STW Catchment	22
1.8. ANDOVERSFORD STW Catchment	24
1.9. APPLETON STW Catchment	26
1.10. ARBORFIELD STW Catchment	29
1.11. ASCOT STW Catchment	31
1.12. ASH RIDGE (WOKINGHAM) STW Catchment	34
1.13. ASH VALE STW Catchment	36
1.14. ASHAMPSTEAD STW Catchment	38
1.15. ASHFORD HILL STW Catchment	40
1.16. ASHTON KEYNES STW Catchment	42
1.17. ASTON LE WALLS STW Catchment	44
1.18. AVON DASSETT STW Catchment	47
1.19. AYLESBURY STW Catchment	49
1.20. BAMPTON STW Catchment	52
1.21. BANBURY STW Catchment	54
1.22. BARFORD STW Catchment	56
1.23. BARKWAY STW Catchment	58
1.24. BASINGSTOKE STW Catchment	60
1.25. BAYDON STW Catchment	63
1.26. BECKLEY STW Catchment	65
1.27. BEENHAM STW Catchment	67
1.28. BENSON STW Catchment	69
1.29. BENTLEY STW Catchment	72
1.30. BERKHAMSTED STW Catchment	74
1.31. BIBURY STW Catchment	77
1.32. BICESTER STW Catchment	79
1.33. BILLINGBEAR STW Catchment	81
1.34. BISHOPS STORTFORD STW Catchment	83
1.35. BLACKBIRDS STW Catchment	86
1.36. BLEDINGTON STW Catchment	88
1.37. BLETCHINGDON STW Catchment	90
1.38. BLOXHAM STW Catchment	92
1.39. BLUNSDON STW Catchment	95
1.40. BODDINGTON STW Catchment	97
1.41. BORDON STW Catchment	99
1.42. BOURTON-ON-THE-WATER STW Catchment	102
1.43. BOURTON OXON STW Catchment	104
1.44. BOXFORD STW Catchment	106
1.45. BRACKNELL STW Catchment	108
1.46. BRAMFIELD STW Catchment	111

1.47.	BRAUGHING STW Catchment	113
1.48.	BRICKENDON STW Catchment	115
1.49.	BRIFF LANE (BUCKLEBURY) STW Catchment	117
1.50.	BROAD HINTON STW Catchment	119
1.51.	BROADWELL STW Catchment	121
1.52.	BROUGHTON STW Catchment	124
1.53.	BUCKLAND STW Catchment	126
1.54.	BUNTINGFORD STW Catchment	128
1.55.	BURFORD STW Catchment	130

Appendix G. All Catchments (excluding London Catchments, LRZ and existing STWs)

This document presents all proformas for the All Catchments section i.e. excluding London Catchments, LRZ and existing STWs. These are environmental baseline proformas that cover the nine SEA topics. Also reported is the sensitivity assigned to the SEA topic based on the rules presented in Table 4-2 of the Main Report.

GSOs listed in the Catchment Proformas are those briefed for the catchment. Significance of effect for each GSO indicated has therefore been generated and are presented in Appendix E. Where no entry is made against the 'GSO Proposed' row, no GSO has been promoted for this location. They are, nevertheless, included here as they inform part of the environmental baseline gathering exercise. Please see Chapter 11 of the Environmental Report and Appendix E which highlights those GSOs promoted in the Final Plan.

1.2. ABBESS RODING STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of ABBESS RODING STW catchment, is designated either at an International, National or Local level. Intersects 7 areas of Priority Habitat which makes up 4 % of the ABBESS RODING STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 6 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 3 religious grounds, 1 playing fields, 0 sports facility, 0 golf courses, 1 public parks and 0 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of ABBESS RODING STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 2 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Of the total area of the catchment, 0 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and	Medium

	operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a As a whole 100 % of ABBESS RODING STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of ABBESS RODING STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 4 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 2 religious grounds, 1 playing fields, 0 sports facility, 0 golf course, 1 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 4 sensitive receptors (School and education centres, hospitals or residential care homes) Matching Green Church Of England (Voluntary Controlled) Primary School, Schools and Education centres St Edmund'S Church, Religious grounds , Playing fields , Public park	Medium
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 0 Flood Alert Areas	Low
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 46 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park	Low

As a whole 0 % of ABBESS RODING STW catchment is designated either AONB or National Park.

1.3. ALDERMASTON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 2 no. SPAs, SACs and/or Ramsar sites Kennet & Lambourn Floodplain, Special Area of Conservation (SAC) River Lambourn, Special Area of Conservation (SAC) Within 2km there are 5 no. SSSI and/or NNR sites Aldermaston Gravel Pits, Site of Special Scientific Interest Woolhampton Reed Bed, Site of Special Scientific Interest Wasing Wood Ponds, Site of Special Scientific Interest Decoy Pit , Pools & Woods, Site of Special Scientific Interest River Kennet, Site of Special Scientific Interest As a whole 0% of ALDERMASTON STW catchment, is designated either at an International, National or Local level. Intersects 11 areas of Priority Habitat which makes up 4 % of the ALDERMASTON STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 6 areas currently utilised for recreation or which benefit the community. This includes 1 allotments, 1 religious grounds, 2 playing fields, 0 sports facility, 0 golf courses, 1 public parks and 0 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. 1.4. ABINGDON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 1 Locally designated sites (LNR) Abbey Fishponds, Local Nature Reserve Within 10km there are 3 no. SPAs, SACs and/or Ramsar sites Cothill Fen, Special Area of Conservation (SAC) Oxford Meadows, Special Area of Conservation (SAC) Little Wittenham, Special Area of Conservation (SAC) Within 2km there are 7 no. SSSI and/or NNR sites Cothill Fen, Site of Special Scientific Interest Barrow Farm Fen, Site of Special Scientific Interest Culham Brake, Site of Special Scientific Interest Dry Sandford Pit, Site of Special Scientific Interest Sugworth, Site of Special Scientific Interest Hurst Hill, Site of Special Scientific Interest Cothill, National Nature Reserve As a whole less than 1% of ABINGDON STW catchment, is designated either at an International, National or Local level. Intersects 178 areas of Priority Habitat which makes up 5 % of the ABINGDON STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 76 areas currently utilised for recreation or which benefit the community. This includes 4 allotments, 8 religious grounds, 36 playing fields, 1 sports facility, 0 golf courses, 12 public parks and 2 cemeteries. Also within the catchment are 13 areas where vulnerable population groups would be expected. This includes 12 Schools and education centres, 1 hospitals, and 0 residential care homes. This is also reflected in the designation of 4 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which	High

	material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of ABINGDON STW catchment 81% is classified as urban.	
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 19 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses River Thames, Watercourses Larkhill Stream, Watercourses River Stert, Watercourses River Ock, Watercourses River Thames In Abingdon, Flood Warning Areas Properties Closest To The River Ock From Tesco To St. Helen'S Wharf, Flood Warning Areas River Stert At Abingdon, Flood Warning Areas River Ock At Abingdon, Flood Warning Areas River Thames For The Abingdon Area, Flood Alert Areas River Ock From Watchfield To Abingdon, And Also The Letcombe Brook At Wantage, Grove And East Hanney, Flood Alert Areas River Stert In Abingdon, Flood Alert Areas Of the total area of the catchment, 13 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Grade 2, Soil grades 2 and 3a Urban, Urban Land As a whole 86 % of ABINGDON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 1 no. areas designated as Air Quality Management Area as follows: Abingdon Aqma, AQMA AQMAs constitute less than 1 % area of ABINGDON STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 11 no. sensitive receptors. This includes 10 Schools and education centres, 1 hospitals, and 0 residential care homes Intersects 40 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 7 religious grounds, 19 playing fields, 1 sports facility, 0 golf course, 11 public park and 2 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 29 sensitive receptors (School and education centres, hospitals or residential care homes) Thomas Reade Primary School Trinity Church Long Furlong Primary School None, Religious grounds	Medium

	Dunmore Primary School Rush Common School St Nicolas Church Of England Primary School Caldecott Primary School Thameside Primary School Sunningwell Church Of England Primary School Carswell Community Primary School St Edmund'S Roman Catholic Primary School Abingdon Hospital None, Allotments Church Of St Mary Magdalene St Helen'S Church Roman Catholic Church Of Our Lady And St Edmund St Leonards Church All Saints Methodist Church St Peter'S Church None, Playing fields None, Sports facility Abbey Gardens, Public park None, Public park Jarn Wild Gardens, Public park Albert Park Southern Town Park Abingdon Marina Park None, Cemeteries	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 137 Flood Warning Areas Contains 93 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 296 Listed Buildings Intersects 8 areas designated as Scheduled Monuments Intersects 2 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of ABINGDON STW catchment is designated either AONB or National Park.	Low

1.5. ALDERSHOT STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 1 Internationally designated sites (SPA, SAC, Ramsar) Thames Basin Heaths, Special Protection Area (SPA) Intersects 1 Nationally designated sites (SSSI and NNR) Bourley And Long Valley, Site of Special Scientific Interest Intersects 1 Locally designated sites (LNR)	High

	Rowhill Copse, Local Nature Reserve Within 10km there are 5 no. SPAs, SACs and/or Ramsar sites Thursley & Ockley Bogs, RAMSAR site Thursley, Ash, Pirbright & Chobham, Special Area of Conservation (SAC) Thames Basin Heaths, Special Protection Area (SPA) Thursley, Hankley & Frensham Commons, Special Protection Area (SPA) Wealden Heaths Phase II, Special Protection Area (SPA) Within 2km there are 5 no. SSSI and/or NNR sites Bourley And Long Valley, Site of Special Scientific Interest Basingstoke Canal, Site of Special Scientific Interest Seale Chalk Pit, Site of Special Scientific Interest Ash To Brookwood Heaths, Site of Special Scientific Interest Eelmoor Marsh, Site of Special Scientific Interest As a whole less than 1% of ALDERSHOT STW catchment, is designated either at an International, National or Local level. Intersects 108 areas of Priority Habitat which makes up 4 % of the ALDERSHOT STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 101 areas currently utilised for recreation or which benefit the community. This includes 5 allotments, 12 religious grounds, 43 playing fields, 5 sports facilities, 0 golf courses, 15 public parks and 2 cemeteries. Also within the catchment are 19 areas where vulnerable population groups would be expected. This includes 19 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 10 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of ALDERSHOT STW catchment 91% is classified as urban.	High
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 2 areas of Source Protections Zones 1 and 2 Intersects 5 Drinking Water Safeguard Zones Intersects 12 statutory rivers / unnamed water bodies. Water environment features intersected include: Blackwater River, Watercourses , Watercourses River Blackwater At Badshot Lea, Flood Warning Areas River Blackwater At Aldershot And Farnborough, Flood Warning Areas River Blackwater And The Cove Brook, Flood Alert Areas Of the total area of the catchment, 8 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	High
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades:	Medium

	Grade 3, Soil grades 2 and 3a Grade 2, Soil grades 2 and 3a Urban, Urban Land As a whole 96 % of ALDERSHOT STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of ALDERSHOT STW catchment. Intersects 2 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 14 no. sensitive receptors. This includes 14 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 47 no areas utilised for recreation or which benefit the community. This includes 4 Allotments, 6 religious grounds, 22 playing fields, 4 sports facility, 0 golf course, 10 public park and 1 cemeteries Within 200 meters, there are 3 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Thames Basin Heaths, Special Protection Area (SPA) Bourley And Long Valley, Site of Special Scientific Interest Basingstoke Canal, Site of Special Scientific Interest Within 200 meters, there are 33 sensitive receptors (School and education centres, hospitals or residential care homes) St Michael'S Church Of England (Controlled) Park Evangelical Church Junior School St Michael'S Church St Paul'S C Of E Infant St Paul'S Church School And Children'S Centre Church Of The Ascension, Walsh Church Of England Junior School The Church Of Jesus Christ Of Latter-Day Alderwood Infant School Saints Alderwood Junior School The Royal Garrison Church Of All Saints Park Primary School None, Playing fields St Michael'S Church Of England (Controlled) None, Sports facility Infant School Talavera Park St Joseph'S Roman Catholic Primary School None, Public park Wellington Community Primary School St Micheal'S Gardens, Public park The Hive Primary School Redan Hill Gardens, Public park Walsh Memorial Church Of England Infant Aldershot Manor Park, Public park School Aldershot Green, Public park Talavera Junior School Princes Gardens, Public park Talavera Infant School Brickfields Park None, Allotments Lakeside Park St Mary'S Roman Catholic Church None, Cemeteries	Medium

1.9. APPLETON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs,	High

	Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 1 Internationally designated sites (SPA, SAC, Ramsar) Cothill Fen, Special Area of Conservation (SAC) Intersects 3 Nationally designated sites (SSSI and NNR) Frilford Heath, Ponds And Fens, Site of Special Scientific Interest Cothill Fen, Site of Special Scientific Interest Dry Sandford Pit, Site of Special Scientific Interest Intersects 0 Locally designated sites (LNR) Within 10km there are 2 no. SPAs, SACs and/or Ramsar sites Cothill Fen, Special Area of Conservation (SAC) Oxford Meadows, Special Area of Conservation (SAC) Within 2km there are 8 no. SSSI and/or NNR sites Frilford Heath, Ponds And Fens, Site of Special Scientific Interest Cothill Fen, Site of Special Scientific Interest Dry Sandford Pit, Site of Special Scientific Interest Appleton Lower Common, Site of Special Scientific Interest Cumnor, Site of Special Scientific Interest Barrow Farm Fen, Site of Special Scientific Interest Hurst Hill, Site of Special Scientific Interest Cothill, National Nature Reserve As a whole less than 1% of APPLETON STW catchment, is designated either at an International, National or Local level. Intersects 165 areas of Priority Habitat which makes up 5 % of the APPLETON STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 35 areas currently utilised for recreation or which benefit the community. This includes 9 allotments, 10 religious grounds, 8 playing fields, 0 sports facility, 2 golf courses, 0 public parks and 1 cemeteries. Also within the catchment are 5 areas where vulnerable population groups would be expected. This includes 5 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 3 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of APPLETON STW catchment 26% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 3 Drinking Water Safeguard Zones Intersects 13 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Sandford Brook, Watercourses River Thames Between Newbridge And Kings Lock Above Oxford, Flood Warning Areas River Ock At Longcot, Stanford In The Vale, Charney Bassett, Lyford And Garford, Flood Warning Areas	Medium

	River Ock From Watchfield To Abingdon, And Also The Letcombe Brook At Wantage, Grove And East Hanney, Flood Alert Areas River Thames And Tributaries From Buscot Wick Down To Kings Lock, Flood Alert Areas Of the total area of the catchment, 2 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a As a whole 94 % of APPLETON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 1 no. areas designated as Air Quality Management Area as follows: Marcham Aqma, AQMA AQMA's constitute 2 % area of APPLETON STW catchment. Intersects 8 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 5 no. sensitive receptors. This includes 5 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 23 no areas utilised for recreation or which benefit the community. This includes 7 Allotments, 8 religious grounds, 6 playing fields, 0 sports facility, 2 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 5 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Cothill Fen, Special Area of Conservation (SAC) Cothill, National Nature Reserve Frilford Heath, Ponds And Fens, Site of Special Scientific Interest Cothill Fen, Site of Special Scientific Interest Dry Sandford Pit, Site of Special Scientific Interest Within 200 meters, there are 17 sensitive receptors (School and education centres, hospitals or residential care homes) Appleton Church Of England Primary School St Nicholas'S Church Cumnor Church Of England Primary School St Lawrence'S Church Dry Sandford Primary School None, Religious grounds Wootton St Peter'S Church Of England St Michael'S Church Primary School St Peter'S Church Marcham Church Of England Primary School St Helen'S Church None, Allotments None, Playing fields Marcham Priory, Religious grounds Frilford Heath Golf Club All Saints' Church None, Cemeteries	High
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 30 Flood Warning Areas Contains 46 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below;	Low

	Intersects 0 World Heritage Sites Intersects 138 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of APPLETON STW catchment is designated either AONB or National Park.	Low

1.10. ARBORFIELD STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 1 Nationally designated sites (SSSI and NNR) Longmoor Bog, Site of Special Scientific Interest Intersects 1 Locally designated sites (LNR) Longmoor Bog, Local Nature Reserve Within 10km there are 2 no. SPAs, SACs and/or Ramsar sites Thursley, Ash, Pirbright & Chobham, Special Area of Conservation (SAC) Thames Basin Heaths, Special Protection Area (SPA) Within 2km there are 5 no. SSSI and/or NNR sites Longmoor Bog, Site of Special Scientific Interest Heath Lake, Site of Special Scientific Interest Bramshill, Site of Special Scientific Interest Wellington College Bog, Site of Special Scientific Interest Sandhurst To Owlsmoor Bogs And Heaths, Site of Special Scientific Interest As a whole less than 1% of ARBORFIELD STW catchment, is designated either at an International, National or Local level. Intersects 284 areas of Priority Habitat which makes up 7 % of the ARBORFIELD STW catchment area.	High
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 41 areas currently utilised for recreation or which benefit the community. This includes 3 allotments, 5 religious grounds, 20 playing fields, 0 sports facility, 5 golf courses, 2 public parks and 0 cemeteries.	High

	Also within the catchment are 6 areas where vulnerable population groups would be expected. This includes 6 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 6 no. Noise Important Areas within the catchment.	
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of ARBORFIELD STW catchment 68% is classified as urban.	High
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 13 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses River Blackwater At Eversley And Bramshill, Flood Warning Areas River Blackwater And The Cove Brook, Flood Alert Areas Emm Brook, Flood Alert Areas Lower River Loddon, Flood Alert Areas Of the total area of the catchment, 3 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Urban, Urban Land As a whole 39 % of ARBORFIELD STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. 1.13. ASH VALE STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 2 Internationally designated sites (SPA, SAC, Ramsar) Thursley, Ash, Pirbright & Chobham, Special Area of Conservation (SAC) Thames Basin Heaths, Special Protection Area (SPA) Intersects 2 Nationally designated sites (SSSI and NNR) Ash To Brookwood Heaths, Site of Special Scientific Interest Basingstoke Canal, Site of Special Scientific Interest Intersects 2 Locally designated sites (LNR) Lakeside Park, Local Nature Reserve Snaky Lane, Local Nature Reserve Within 10km there are 4 no. SPAs, SACs and/or Ramsar sites Thursley & Ockley Bogs, RAMSAR site Thursley, Ash, Pirbright & Chobham, Special Area of Conservation (SAC) Thames Basin Heaths, Special Protection Area (SPA) Thursley, Hankley & Frensham Commons, Special Protection Area (SPA) Within 2km there are 3 no. SSSI and/or NNR sites Ash To Brookwood Heaths, Site of Special Scientific Interest Basingstoke Canal, Site of Special Scientific Interest Seale Chalk Pit, Site of Special Scientific Interest As a whole less than 1% of ASH VALE STW catchment, is designated either at an International, National or Local level. Intersects 150 areas of Priority Habitat which makes up 3 % of the ASH VALE STW catchment area.	High
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the	High

	environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 44 areas currently utilised for recreation or which benefit the community. This includes 3 allotments, 2 religious grounds, 23 playing fields, 1 sports facility, 0 golf courses, 6 public parks and 0 cemeteries. Also within the catchment are 9 areas where vulnerable population groups would be expected. This includes 9 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 6 no. Noise Important Areas within the catchment.	
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of ASH VALE STW catchment 85% is classified as urban.	High
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 4 Drinking Water Safeguard Zones Intersects 4 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Blackwater River, Watercourses Basingstoke Canal, Watercourses River Blackwater At Aldershot And Farnborough, Flood Warning Areas River Blackwater And The Cove Brook, Flood Alert Areas Of the total area of the catchment, 12 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Urban, Urban Land As a whole 80 % of ASH VALE STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Low
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of ASH VALE STW catchment. Intersects 4 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 5 no. sensitive receptors. This includes 5 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 20 no areas utilised for recreation or which benefit the community. This includes 2 Allotments, 2 religious grounds, 11 playing fields, 0 sports facility, 0 golf course, 5 public park and 0 cemeteries Within 200 meters, there are 4 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Thursley, Ash, Pirbright & Chobham, Special Area of Conservation (SAC) Thames Basin Heaths, Special Protection Area (SPA)	Medium

	Ash To Brookwood Heaths, Site of Special Scientific Interest Basingstoke Canal, Site of Special Scientific Interest Within 200 meters, there are 13 sensitive receptors (School and education centres, hospitals or residential care homes) Holly Lodge Primary School, Schools and Education centres Shawfield Primary School, Schools and Education centres Ash Grange Children'S Centre And Primary School, Schools and Education centres Walsh Memorial Church Of England Infant School, Schools and Education centres Walsh Church Of England Junior School, Schools and Education centres South Farnborough Junior School, Schools and Education centres None, Allotments St Peter'S Church, Religious grounds Roman Catholic Church Of The Holy Angels, Religious grounds None, Playing fields Lakeside Park, Public park Sandy Lane Nature Reserve, Public park None, Public park	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 4 Flood Warning Areas Contains 13 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 15 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of ASH VALE STW catchment is designated either AONB or National Park.	Low

1.14. ASHAMPSTEAD STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR)	Medium

	Intersects 0 Locally designated sites (LNR) Within 10km there are 1 no. SPAs, SACs and/or Ramsar sites Hartslock Wood, Special Area of Conservation (SAC) Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of ASHAMPSTEAD STW catchment, is designated either at an International, National or Local level. Intersects 6 areas of Priority Habitat which makes up 5 % of the ASHAMPSTEAD STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of AVON DASSETT STW catchment, is designated either at an International, National or Local level. Intersects 2 areas of Priority Habitat which makes up less than 1 % of the AVON DASSETT STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 3 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 2 religious grounds, 1 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 0 cemeteries. Also within the catchment are 0 areas where vulnerable population groups would be expected. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of AVON DASSETT STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 0 Drinking Water Safeguard Zones Intersects 0 statutory rivers / unnamed water bodies. Water environment features intersected include: Of the total area of the catchment, 0 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Low
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and	Medium

	operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a As a whole 65 % of AVON DASSETT STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of AVON DASSETT STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 0 no. sensitive receptors. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 3 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 2 religious grounds, 1 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 3 sensitive receptors (School and education centres, hospitals or residential care homes) St John The Baptist'S Church, Religious grounds St Joseph'S Church, Religious grounds , Playing fields	Medium
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 0 Flood Alert Areas	Low
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 25 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of AVON DASSETT STW catchment is designated either AONB or National Park.	Medium

1.19. AYLESBURY STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 4 Nationally designated sites (SSSI and NNR) Bacombe And Coombe Hills, Site of Special Scientific Interest Tring Reservoirs, Site of Special Scientific Interest Bierton Clay Pit, Site of Special Scientific Interest Weston Turville Reservoir, Site of Special Scientific Interest Intersects 1 Locally designated sites (LNR) Bacombe Hill, Local Nature Reserve Within 10km there are 1 no. SPAs, SACs and/or Ramsar sites Chilterns Beechwoods, Special Area of Conservation (SAC) Within 2km there are 9 no. SSSI and/or NNR sites Bacombe And Coombe Hills, Site of Special Scientific Interest Tring Reservoirs, Site of Special Scientific Interest Bierton Clay Pit, Site of Special Scientific Interest Weston Turville Reservoir, Site of Special Scientific Interest Aston Clinton Ragpits, Site of Special Scientific Interest Pitstone Quarry, Site of Special Scientific Interest Bugle Quarry, Site of Special Scientific Interest Dancersend, Site of Special Scientific Interest Stone, Site of Special Scientific Interest As a whole less than 1% of AYLESBURY STW catchment, is designated either at an International, National or Local level. Intersects 180 areas of Priority Habitat which makes up 2 % of the AYLESBURY STW catchment area.	High
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 191 areas currently utilised for recreation or which benefit the community. This includes 22 allotments, 26 religious grounds, 88 playing fields, 7 sports facility, 3 golf courses, 6 public parks and 2 cemeteries. Also within the catchment are 37 areas where vulnerable population groups would be expected. This includes 33 Schools and education centres, 4 hospitals, and 0 residential care homes. This is also reflected in the designation of 30 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of AYLESBURY STW catchment 60% is classified as urban.	Medium
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following:	Medium

	Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 4 Drinking Water Safeguard Zones Intersects 33 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Tring Bourne, Watercourses California Brook, Watercourses Bear Brook, Watercourses Grand Union Canal, Watercourses River Thame, Watercourses Wendover Stream, Watercourses Bear Brook And Tributaries, From Broughton To Haydon Mill Farm In Coldharbour, Aylesbury, Flood Warning Areas Bear Brook And Tributaries, From Walton Court In The Ellen Road Area Down To St Marys School, Flood Warning Areas Bear Brook And Tributaries At Wendover And Weston Turville, Flood Warning Areas River Thame From Long Marston To Eythrope, Flood Warning Areas River Thame And Chalgrove Brook, Flood Alert Areas Bear Brook And Tributaries In The Aylesbury Area, Including Wendover And Weston Turville, Flood Alert Areas Of the total area of the catchment, 9 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.							
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a Urban, Urban Land As a whole 88 % of AYLESBURY STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BARFORD STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 1 statutory rivers / unnamed water bodies. Water environment features intersected include: River Swere, Watercourses River Cherwell From Charwelton To Just Above Upper Heyford, Flood Alert Areas Of the total area of the catchment, less than 1 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a As a whole 73 % of BARFORD STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows;	Medium

	Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of BARFORD STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 0 no. sensitive receptors. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 3 no areas utilised for recreation or which benefit the community. This includes 1 Allotments, 2 religious grounds, 0 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 3 sensitive receptors (School and education centres, hospitals or residential care homes) None, Allotments St Michael'S Church, Religious grounds St John'S Church, Religious grounds	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 13 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 44 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BARFORD STW catchment is designated either AONB or National Park.	Low

1.23. BARKWAY STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR)	Medium

	Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of BARKWAY STW catchment, is designated either at an International, National or Local level. Intersects 15 areas of Priority Habitat which makes up 5 % of the BARKWAY STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 6 areas currently utilised for recreation or which benefit the community. This includes 1 allotments, 1 religious grounds, 1 playing fields, 0 sports facility, 1 golf courses, 0 public parks and 1 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BARKWAY STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 3 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Rivers Rib And Quin, Flood Alert Areas Of the total area of the catchment, less than 1 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a As a whole 100 % of BARKWAY STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows:	Medium

	AQMAs constitute 0 % area of BARKWAY STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 5 no areas utilised for recreation or which benefit the community. This includes 1 Allotments, 1 religious grounds, 1 playing fields, 0 sports facility, 1 golf course, 0 public park and 1 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 6 sensitive receptors (School and education centres, hospitals or residential care homes) Barkway (Voluntary Aided) Church Of England First School None, Allotments St Mary Magdalene'S Church, Religious grounds None, Playing fields None, Golf course None, Cemeteries	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 3 Flood Warning Areas Contains 11 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 151 Listed Buildings Intersects 8 areas designated as Scheduled Monuments Intersects 3 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BASINGSTOKE STW catchment is designated either AONB or National Park.	Low

1.25. BAYDON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 3 no. SPAs, SACs and/or Ramsar sites River Lambourn, Special Area of Conservation (SAC) Kennet & Lambourn Floodplain, Special Area of Conservation (SAC) Hackpen Hill, Special Area of Conservation (SAC) Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of BAYDON STW catchment, is designated either at an International, National or Local level.	Medium

	Intersects 3 areas of Priority Habitat which makes up less than 1 % of the BAYDON STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 6 areas currently utilised for recreation or which benefit the community. This includes 1 allotments, 1 religious grounds, 2 playing fields, 0 sports facility, 0 golf courses, 1 public parks and 0 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BAYDON STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 0 Drinking Water Safeguard Zones Intersects 0 statutory rivers / unnamed water bodies. Water environment features intersected include: Of the total area of the catchment, 0 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Low
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a As a whole 100 % of BAYDON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of BAYDON STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 5 no areas utilised for recreation or which benefit the community. Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 1 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Of the total area of the catchment, 0 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Grade 2, Soil grades 2 and 3a As a whole 100 % of BECKLEY STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of BECKLEY STW catchment.	Medium

	Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 2 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 1 religious grounds, 1 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 5 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Otmoor, Site of Special Scientific Interest Holly Wood, Site of Special Scientific Interest Sidling'S Copse And College Pond, Site of Special Scientific Interest Stanton Great Wood, Site of Special Scientific Interest Woodeaton Wood, Site of Special Scientific Interest Within 200 meters, there are 3 sensitive receptors (School and education centres, hospitals or residential care homes) Beckley Church Of England Primary School, Schools and Education centres St Mary'S Church, Religious grounds , Playing fields	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 0 Flood Alert Areas	Low
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 26 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BECKLEY STW catchment is designated either AONB or National Park.	Low

1.27. BEENHAM STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar)	Medium

	Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 3 no. SPAs, SACs and/or Ramsar sites Kennet & Lambourn Floodplain, Special Area of Conservation (SAC) Hartslock Wood, Special Area of Conservation (SAC) River Lambourn, Special Area of Conservation (SAC) Within 2km there are 3 no. SSSI and/or NNR sites Old Copse, Beenham, Site of Special Scientific Interest King'S Copse, Site of Special Scientific Interest Aldermaston Gravel Pits, Site of Special Scientific Interest As a whole 0% of BEENHAM STW catchment, is designated either at an International, National or Local level. Intersects 10 areas of Priority Habitat which makes up 1 % of the BEENHAM STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 5 areas currently utilised for recreation or which benefit the community. This includes 1 allotments, 1 religious grounds, 1 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 1 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BEENHAM STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 0 statutory rivers / unnamed water bodies. Water environment features intersected include: Of the total area of the catchment, 0 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 1 no. SSSI and/or NNR sites Winson Meadows, Site of Special Scientific Interest As a whole 0% of BIBURY STW catchment, is designated either at an International, National or Local level. Intersects 14 areas of Priority Habitat which makes up 5 % of the BIBURY STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 5 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 2 religious grounds, 1 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 1 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BIBURY STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 1 areas of Source Protections Zones 1 and 2 Intersects 0 Drinking Water Safeguard Zones	Medium

	Intersects 5 statutory rivers / unnamed water bodies. Water environment features intersected include: River Coln, Watercourses River Coln From Fossebridge To Quennington, Flood Warning Areas River Coln And Its Tributaries, Flood Alert Areas Of the total area of the catchment, 6 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a As a whole 92 % of BIBURY STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of BIBURY STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 3 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 2 religious grounds, 0 playing fields, 0 sports facility, 0 golf course, 0 public park and 1 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 5 sensitive receptors (School and education centres, hospitals or residential care homes) Bibury Church Of England Primary School, Schools and Education centres None, Religious grounds St Mary'S Church, Religious grounds Bibury Playground, Playing fields None, Cemeteries	Medium
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 6 Flood Warning Areas Contains 14 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 92 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low

Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty Cotswolds, Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 100 % of BIBURY STW catchment is designated either AONB or National Park.	High

1.32. BICESTER STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 2 Nationally designated sites (SSSI and NNR) Ardley Trackways, Site of Special Scientific Interest Ardley Cutting And Quarry, Site of Special Scientific Interest Intersects 1 Locally designated sites (LNR) Bure Park, Local Nature Reserve Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 8 no. SSSI and/or NNR sites Ardley Trackways, Site of Special Scientific Interest Ardley Cutting And Quarry, Site of Special Scientific Interest Arncott Bridge Meadows, Site of Special Scientific Interest Stratton Audley Quarries, Site of Special Scientific Interest Wendlebury Meads And Mansmoor Closes, Site of Special Scientific Interest Muswell Hill, Site of Special Scientific Interest Whitcross Green And Oriel Woods, Site of Special Scientific Interest Rushbeds Wood And Railway Cutting, Site of Special Scientific Interest As a whole less than 1% of BICESTER STW catchment, is designated either at an International, National or Local level. Intersects 156 areas of Priority Habitat which makes up 4 % of the BICESTER STW catchment area.	High
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 160 areas currently utilised for recreation or which benefit the community. This includes 14 allotments, 9 religious grounds, 106 playing fields, 1 sports facility, 1 golf courses, 13 public parks and 1 cemeteries. Also within the catchment are 15 areas where vulnerable population groups would be expected. This includes 14 Schools and education centres, 1 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium

Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BICESTER STW catchment 49% is classified as urban.	Medium
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 14 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Gagle Brook, Watercourses River Ray, Watercourses Langford Village And Other Areas Of Bicester On The Langford Brook, Flood Warning Areas River Ray From The Heath Bridge Area To And Including The Otmoor Basin, Flood Warning Areas Wendlebury Village On The Wendlebury Brook, Flood Warning Areas River Ray And Its Tributaries From Shipton Lee To And Including Islip, Flood Alert Areas Langford And Wendlebury Brooks From Stratton Audley Down To Near Merton, Flood Alert Areas Of the total area of the catchment, 6 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Urban, Urban Land As a whole 46 % of BICESTER STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium

This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 2 no areas utilised for recreation or which benefit the community. This includes 1 Allotments, 1 religious grounds, 0 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar)	Medium

	Within 200 meters, there are 6 sensitive receptors (School and education centres, hospitals or residential care homes) Fair Field Junior School, Schools and Education centres St John'S Church Of England Infant And Nursery School, Schools and Education centres None, Allotments Church Of St John, Religious grounds None, Playing fields Radlett Bowls Club, Sports facility	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 1 Flood Warning Areas Contains 1 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 2 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BLACKBIRDS STW catchment is designated either AONB or National Park.	Low

1.36. BLEDINGTON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 1 no. SSSI and/or NNR sites Bould Wood, Site of Special Scientific Interest	Medium

	As a whole 0% of BLEDINGTON STW catchment, is designated either at an International, National or Local level. Intersects 18 areas of Priority Habitat which makes up 10 % of the BLEDINGTON STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 8 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 3 religious grounds, 2 playing fields, 0 sports facility, 0 golf courses, 1 public parks and 1 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BLEDINGTON STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 3 statutory rivers / unnamed water bodies. Water environment features intersected include: Westcote Brook, Watercourses , Watercourses River Evenlode From Moreton In Marsh To Cassington And Also The River Glyme At Wootton And Woodstock, Flood Alert Areas Of the total area of the catchment, 9 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a As a whole 97 % of BLEDINGTON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMA's constitute 0 % area of BLEDINGTON STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes	Medium

	Intersects 7 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 3 religious grounds, 2 playing fields, 0 sports facility, 0 golf course, 1 public park and 1 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 6 sensitive receptors (School and education centres, hospitals or residential care homes) Bledington Primary School, Schools and Education centres St Mary'S Church, Religious grounds St Leonard'S Church, Religious grounds None, Playing fields The Green, Public park None, Cemeteries	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 11 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 55 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty Cotswolds, Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 100 % of BLEDINGTON STW catchment is designated either AONB or National Park.	High

1.37. BLETCHINGDON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 0 Flood Alert Areas	Low
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 39 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty	Low

	Intersects 0 areas designated as National Park	
	As a whole 0 % of BODDINGTON STW catchment is designated either AONB or National Park.	

1.41. BORDON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 3 Internationally designated sites (SPA, SAC, Ramsar) Woolmer Forest, Special Area of Conservation (SAC) Shortheath Common, Special Area of Conservation (SAC) Wealden Heaths Phase II, Special Protection Area (SPA) Intersects 6 Nationally designated sites (SSSI and NNR) Shortheath Common, SSSI Devil's Punch Bowl, SSSI Bramshott And Ludshott Commons, SSSI Woolmer Forest, SSSI Broxhead And Kingsley Commons, SSSI Forest Mere, SSSI Intersects 2 Locally designated sites (LNR) Deadwater Valley, Local Nature Reserve Shortheath Common, Local Nature Reserve Within 10km there are 7 no. SPAs, SACs and/or Ramsar sites Thursley & Ockley Bogs, RAMSAR site Woolmer Forest, (SAC) East Hampshire Hangers, (SAC) Shortheath Common, (SAC) Wealden Heaths Phase II, (SPA) Thursley, Ash, Pirbright & Chobham, (SAC) Thursley, Hankley & Frensham Commons, (SPA) Within 2km there are 14 no. SSSI and/or NNR sites Shortheath Common, SSSI Wick Wood And Worldham Hangers, SSSI Bramshott And Ludshott Commons, SSSI Chapel Common, SSSI Broxhead And Kingsley Commons, SSSI Upper Greensand Hangers : Wyck To Devil's Punch Bowl, SSSI Wheatley, SSSI Woolmer Forest, SSSI Upper Greensand Hangers Forest Mere, SSSI : Empshott To Hawkley, SSSI Binswood, SSSI Coombe Wood And The Lythe, SSSI Stockstone Quarry, SSSI Thursley, Hankley & Frensham Commons, SSSI As a whole less than 1% of BORDON STW catchment, is designated either at an International, National or Local level. Intersects 822 areas of Priority Habitat which makes up 11 % of the BORDON STW catchment area.	High
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 129 areas currently utilised for recreation or which benefit the community. This includes 8 allotments, 11 religious grounds, 47 playing fields, 3 sports facility, 12 golf courses, 28 public parks and 4 cemeteries.	High

	Also within the catchment are 16 areas where vulnerable population groups would be expected. This includes 15 Schools and education centres, 1 hospitals, and 0 residential care homes. This is also reflected in the designation of 13 no. Noise Important Areas within the catchment.	
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BORDON STW catchment 38% is classified as urban.	Medium
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 1 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 19 statutory rivers / unnamed water bodies. Water environment features intersected include: Holly Water, Watercourses River Wey, Watercourses , Watercourses Oakhanger Stream, Watercourses Dead Water, Watercourses Oxney Moss, Watercourses River Wey At Passfield Mill Business Park, Standford, Frensham And Millbridge, Flood Warning Areas Upper River Wey, Flood Alert Areas Of the total area of the catchment, less than 1 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	High
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Grade 2, Soil grades 2 and 3a As a whole 20 % of BORDON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of BORDON STW catchment. Intersects 18 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 11 no. sensitive receptors. This includes 10 Schools and education centres, 1 hospitals, and 0 residential care homes Intersects 78 no areas utilised for recreation or which benefit the community. This includes 7 Allotments, 11 religious grounds, 24 playing fields, 2 sports facility, 4 golf course, 28 public park and 2 cemeteries Within 200 meters, there are 9 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Woolmer Forest, Special Area of Conservation Broxhead And Kingsley Commons, SSSI (SAC) Devil'S Punch Bowl, SSSI Shortheath Common, Special Area of Conservation (SAC) Woolmer Forest, SSSI Forest Mere, SSSI	Medium

	Wealden Heaths Phase II, Special Protection Area (SPA) Shortheath Common, SSSI Bramshott And Ludshott Commons, SSSI Within 200 meters, there are 43 sensitive receptors (School and education centres, hospitals or residential care homes) St Matthew'S Church Of England (Aided) Primary School Grayshott Ce Primary School Weyford Primary School And Nursery Liphook Junior School Liphook Infant School Beacon Hill Community Primary School St John'S Church Of England (Aided) Infant School Churcher'S College Junior School The Holme Primary School Woodlea Primary School The Royal Junior School Bordon Infant School Bordon Junior School Chase Community Hospital None, Allotments All Saint'S Church None, Religious grounds St John'S Church St Matthew'S Church St Joseph'S Church St Luke'S Church St Mary'S Church The Church Of The Immaculate Conception St Francis Church Parish Church Of All Saints Church Of The Sacred Heart None, Playing fields None, Sports facility Blackmoor Golf Course None, Golf course Hindhead Golf Course Liphook Golf Course Upper Green, Public park Kingsley Common, Public park Broxhead Common, Public park Redhearn Green, Public park Grovers Gardens, Public park None, Public park Radford Park Lowsley Farm, Public park None, Cemeteries Heatherley Wood Natural Burial Ground Whitehill Cemetery	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 1 Flood Warning Areas Contains 23 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 94 Listed Buildings Intersects 3 areas designated as Scheduled Monuments Intersects 1 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty Surrey Hills, Area of Outstanding Natural Beauty Intersects 1 areas designated as National Park South Downs, National Park As a whole 13 % of BORDON STW catchment is designated either AONB or National Park.	High

1.45. BRACKNELL STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 2 Nationally designated sites (SSSI and NNR) Englemere Pond, Site of Special Scientific Interest Wykery Copse, Site of Special Scientific Interest Intersects 8 Locally designated sites (LNR) Farley Copse, Local Nature Reserve Englemere Pond, Local Nature Reserve Jock'S Copse, Local Nature Reserve Piggy Wood, Local Nature Reserve Tinkers Copse, Local Nature Reserve Temple Copse, Local Nature Reserve Whitegrove Copse, Local Nature Reserve Hayley Green Wood, Local Nature Reserve Within 10km there are 5 no. SPAs, SACs and/or Ramsar sites	High

	South West London Waterbodies, RAMSAR site Windsor Forest & Great Park, (SAC) Thursley, Ash, Pirbright & Chobham, (SAC) Within 2km there are 6 no. SSSI and/or NNR sites Englemere Pond, Site of Special Scientific Interest Wykery Copse, Site of Special Scientific Interest Swinley Park And Brick Pits, Site of Special Scientific Interest Thames Basin Heaths, (SPA) South West London Waterbodies, (SPA) Broadmoor To Bagshot Woods And Heaths, Site of Special Scientific Interest Windsor Forest And Great Park, Site of Special Scientific Interest Chawridge Bourne, Site of Special Scientific Interest As a whole less than 1% of BRACKNELL STW catchment, is designated either at an International, National or Local level. Intersects 542 areas of Priority Habitat which makes up 6 % of the BRACKNELL STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 199 areas currently utilised for recreation or which benefit the community. This includes 13 allotments, 19 religious grounds, 90 playing fields, 2 sports facility, 5 golf courses, 36 public parks and 7 cemeteries. Also within the catchment are 27 areas where vulnerable population groups would be expected. This includes 26 Schools and education centres, 1 hospitals, and 0 residential care homes. This is also reflected in the designation of 23 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BRACKNELL STW catchment 82% is classified as urban.	High
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 24 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Bull Brook, Watercourses The Cut, Watercourses Blackmoor Stream, Watercourses Cut At Ryehurst Lane, Westley Mill And Paley Street, Flood Warning Areas Cut From Three Legged Cross To Binfield Manor, Flood Warning Areas Cut, Flood Alert Areas Of the total area of the catchment, 5 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Urban, Urban Land As a whole 86 % of BRACKNELL STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows;	High

	Intersects 1 no. areas designated as Air Quality Management Area as follows: Area 1: The Bagshot Road (A322) Horse And Groom Roundabout Downshire Way Aqma, AQMA AQMA's constitute less than 1 % area of BRACKNELL STW catchment. Intersects 2 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 23 no. sensitive receptors. This includes 23 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 140 no areas utilised for recreation or which benefit the community. This includes 12 Allotments, 17 religious grounds, 70 playing fields, 2 sports facility, 4 golf course, 31 public park and 4 cemeteries Within 200 meters, there are 7 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Windsor Forest & Great Park, Special Area of Conservation (SAC) Swinley Park And Brick Pits, Site of Special Scientific Interest Thames Basin Heaths, Special Protection Area Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 2 Flood Warning Areas Contains 11 Flood Alert Areas	Medium																																																																																																												

Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 140 Listed Buildings Intersects 4 areas designated as Scheduled Monuments Intersects 3 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BRACKNELL STW catchment is designated either AONB or National Park.	Low

1.46. BRAMFIELD STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 3 no. SPAs, SACs and/or Ramsar sites Lee Valley, RAMSAR site Wormley-Hoddesdonpark Woods, Special Area of Conservation (SAC) Lee Valley, Special Protection Area (SPA) Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of BRAMFIELD STW catchment, is designated either at an International, National or Local level. Intersects 5 areas of Priority Habitat which makes up 3 % of the BRAMFIELD STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 2 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 1 religious grounds, 1 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 0 cemeteries.	Medium

	Also within the catchment are 0 areas where vulnerable population groups would be expected. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.

Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 0 Flood Alert Areas	Low
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 9 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BRICKENDON STW catchment is designated either AONB or National Park.	Low

1.49. BRIFF LANE (BUCKLEBURY) STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 4 no. SPAs, SACs and/or Ramsar sites Kennet & Lambourn Floodplain, Special Area of Conservation (SAC) River Lambourn, Special Area of Conservation (SAC) Kennet Valley Alderwoods, Special Area of Conservation (SAC) Hartslock Wood, Special Area of Conservation (SAC)	Medium

	Within 2km there are 2 no. SSSI and/or NNR sites Briff Lane Meadows, Site of Special Scientific Interest King'S Copse, Site of Special Scientific Interest As a whole 0% of BRIFF LANE (BUCKLEBURY) STW catchment, is designated either at an International, National or Local level. Intersects 36 areas of Priority Habitat which makes up 8 % of the BRIFF LANE (BUCKLEBURY) STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 7 areas currently utilised for recreation or which benefit the community. This includes 1 allotments, 2 religious grounds, 2 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 1 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BRIFF LANE (BUCKLEBURY) STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 1 statutory rivers / unnamed water bodies. Water environment features intersected include: River Pang, Watercourses River Pang At Bucklebury, Flood Warning Areas River Pang From East Ilsley To Pangbourne And Sulham Brook, Flood Alert Areas Of the total area of the catchment, 10 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a As a whole 31 % of BRIFF LANE (BUCKLEBURY) STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows:	Medium

	AQMAs constitute 0 % area of BRIFF LANE (BUCKLEBURY) STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 4 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 2 religious grounds, 2 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 1 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Briff Lane Meadows, Site of Special Scientific Interest Within 200 meters, there are 6 sensitive receptors (School and education centres, hospitals or residential care homes) Bucklebury Church Of England Primary School, Schools and Education centres None, Allotments All Saints Church And Centre, Religious grounds St Mary'S Church, Religious grounds None, Playing fields Bucklebury Cemetery, Cemeteries	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 1 Communities at Risk Areas (flooding) Contains 1 Flood Warning Areas Contains 5 Flood Alert Areas	High
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 22 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty North Wessex Downs, Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 93 % of BRIFF LANE (BUCKLEBURY) STW catchment is designated either AONB or National Park.	High

1.50. BROAD HINTON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar)	Medium

The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 0 Flood Alert Areas	Low
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are	Medium

	recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 41 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 1 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BUCKLAND STW catchment is designated either AONB or National Park.	Low

1.54. BUNTINGFORD STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of BUNTINGFORD STW catchment, is designated either at an International, National or Local level. Intersects 29 areas of Priority Habitat which makes up less than 1 % of the BUNTINGFORD STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 23 areas currently utilised for recreation or which benefit the community. This includes 3 allotments, 3 religious grounds, 11 playing fields, 1 sports facility, 0 golf courses, 1 public parks and 1 cemeteries. Also within the catchment are 3 areas where vulnerable population groups would be expected. This includes 3 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 2 no. Noise Important Areas within the catchment.	High

Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BUNTINGFORD STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 1 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 4 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses River Rib, Watercourses The Bourne, Watercourses River Rib At Buntingford To Barwick, Flood Warning Areas Rivers Rib And Quin, Flood Alert Areas Of the total area of the catchment, 11 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	High
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a As a whole 100 % of BUNTINGFORD STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMA's constitute 0 % area of BUNTINGFORD STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 3 no. sensitive receptors. This includes 3 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 13 no areas utilised for recreation or which benefit the community. This includes 2 Allotments, 3 religious grounds, 6 playing fields, 1 sports facility, 0 golf course, 1 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 9 sensitive receptors (School and education centres, hospitals or residential care homes) Millfield First And Nursery School, Schools and Education centres Edwinstree Church Of England Middle School, Schools and Education centres Layston Church Of England First School, Schools and Education centres None, Allotments St Mary'S Church, Religious grounds St Andrew'S Church, Religious grounds None, Playing fields None, Sports facility Layston Court Gardens, Public park	Medium

Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 1 Communities at Risk Areas (flooding) Contains 1 Flood Warning Areas Contains 1 Flood Alert Areas	High
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 148 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of BUSCOT STW catchment is designated either AONB or National Park.	Low

1.59. BYFIELD STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of BYFIELD STW catchment, is designated either at an International, National or Local level. Intersects 18 areas of Priority Habitat which makes up less than 1 % of the BYFIELD STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 14 areas currently utilised for recreation or which benefit the community. This includes 3 allotments, 2 religious grounds, 4 playing fields, 2 sports facility, 0 golf courses, 0 public parks and 1 cemeteries. Also within the catchment are 2 areas where vulnerable population groups would be expected. This includes 2 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of BYFIELD STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 2 statutory rivers / unnamed water bodies. Water environment features intersected include: River Cherwell, Watercourses , Watercourses River Cherwell From Charwelton To Above Banbury, Flood Warning Areas River Cherwell From Charwelton To Just Above Upper Heyford, Flood Alert Areas Of the total area of the catchment, 3 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium

Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a As a whole 100 % of BYFIELD STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of BYFIELD STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 2 no. sensitive receptors. This includes 2 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 7 no areas utilised for recreation or which benefit the community. This includes 2 Allotments, 2 religious grounds, 2 playing fields, 1 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 8 sensitive receptors (School and education centres, hospitals or residential care homes) Byfield School, Schools and Education centres Woodford Halse Church Of England Academy, Schools and Education centres None, Allotments St Mary'S Church, Religious grounds Holy Cross Church, Religious grounds None, Playing fields None, Sports facility None, Cemeteries	Medium
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 2 Communities at Risk Areas (flooding) Contains 5 Flood Warning Areas Contains 13 Flood Alert Areas	High
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 48 Listed Buildings Intersects 1 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered;	Low

	Intersects 0 areas designated as Area of Outstanding Natural Beauty	
	Intersects 0 areas designated as National Park	
	As a whole 0 % of BYFIELD STW catchment is designated either AONB or National Park.	

1.60. CADDINGTON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. SSSI and/or NNR sites Rushy Meadows, Site of Special Scientific Interest Cassington Meadows, Site of Special Scientific Interest Pixey And Yarnton Meads, Site of Special Scientific Interest Wytham Ditches And Flushes, Site of Special Scientific Interest Wytham Woods, Site of Special Scientific Interest Shipton-On-Cherwell & Whitehill Farm Quarries, Site of Special Scientific Interest Blenheim Park, Site of Special Scientific Interest As a whole 0% of CASSINGTON STW catchment, is designated either at an International, National or Local level.	Medium

	Intersects 16 areas of Priority Habitat which makes up less than 1 % of the CASSINGTON STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 41 areas currently utilised for recreation or which benefit the community. This includes 9 allotments, 6 religious grounds, 16 playing fields, 2 sports facility, 0 golf courses, 0 public parks and 2 cemeteries. Also within the catchment are 6 areas where vulnerable population groups would be expected. This includes 6 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 6 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CASSINGTON STW catchment 57% is classified as urban.	Medium
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 3 Drinking Water Safeguard Zones Intersects 3 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses Chil Brook, Watercourses River Thames Between Newbridge And Kings Lock Above Oxford, Flood Warning Areas River Evenlode At Eynsham Mill Down To And Including Cassington Mill Near Cassington, Flood Warning Areas River Evenlode From Moreton In Marsh To Cassington And Also The River Glyme At Wootton And Woodstock, Flood Alert Areas River Thames And Tributaries From Buscot Wick Down To Kings Lock, Flood Alert Areas Of the total area of the catchment, 2 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Grade 2, Soil grades 2 and 3a Urban, Urban Land As a whole 97 % of CASSINGTON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows:	Medium

	AQMAs constitute 0 % area of CASSINGTON STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 5 no. sensitive receptors. This includes 5 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 26 no areas utilised for recreation or which benefit the community. This includes 6 Allotments, 6 religious grounds, 11 playing fields, 2 sports facility, 0 golf course, 0 public park and 1 cemeteries Within 200 meters, there are 1 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Rushy Meadows, Site of Special Scientific Interest Within 200 meters, there are 16 sensitive receptors (School and education centres, hospitals or residential care homes) North Kidlington Primary School, Schools and Education centres West Kidlington Primary And Nursery Schools, Schools and Education centres St Thomas More Catholic Primary School, Schools and Education centres Eynsham Community Primary School, Schools and Education centres St Peter'S Church Of England Primary School, Schools and Education centres Edward Field Primary And Nursery Schools, Schools and Education centres None, Allotments St Johns Hall, Religious grounds St Leonard'S Church, Religious grounds St Peter'S Church, Religious grounds St Michael'S Church, Religious grounds St Philip'S Priory, Religious grounds None, Playing fields None, Sports facility None, Cemeteries Kidlington Cemetery, Cemeteries	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 5 Communities at Risk Areas (flooding) Contains 14 Flood Warning Areas Contains 25 Flood Alert Areas	High
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 112 Listed Buildings Intersects 5 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of CASSINGTON STW catchment is designated either AONB or National Park.	Low

1.64. CHACOMBE STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of CHACOMBE STW catchment, is designated either at an International, National or Local level. Intersects 6 areas of Priority Habitat which makes up 2 % of the CHACOMBE STW catchment area.	Medium

Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 2 Communities at Risk Areas (flooding) Contains 14 Flood Warning Areas Contains 17 Flood Alert Areas		High
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 7 Listed Buildings Intersects 6 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites		Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty Chilterns, Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 2 % of CHALTON (AW) STW catchment is designated either AONB or National Park.		High

1.68. CHAPEL ROW STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 3 no. SPAs, SACs and/or Ramsar sites Kennet & Lambourn Floodplain, Special Area of Conservation (SAC) River Lambourn, Special Area of Conservation (SAC) Hartslock Wood, Special Area of Conservation (SAC) Within 2km there are 2 no. SSSI and/or NNR sites King'S Copse, Site of Special Scientific Interest Old Copse, Beenham, Site of Special Scientific Interest As a whole 0% of CHAPEL ROW STW catchment, is designated either at an International, National or Local level. Intersects 17 areas of Priority Habitat which makes up 11 % of the CHAPEL ROW STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 0 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 0 religious grounds, 0 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 0 cemeteries. Also within the catchment are 0 areas where vulnerable population groups would be expected. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Low
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CHAPEL ROW STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 0 Drinking Water Safeguard Zones Intersects 0 statutory rivers / unnamed water bodies. Water environment features intersected include:	Low

	Of the total area of the catchment, 0 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a As a whole 59 % of CHAPEL ROW STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of CHAPEL ROW STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 0 no. sensitive receptors. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 0 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 0 religious grounds, 0 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 0 sensitive receptors (School and education centres, hospitals or residential care homes)	Low

Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 14 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of CHARNEY BASSETT STW catchment is designated either AONB or National Park.	Low

1.73. CHARWELTON STW Catchment

Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 0 no. SSSI and/or NNR sites As a whole 0% of CHARWELTON STW catchment, is designated either at an International, National or Local level. Intersects 7 areas of Priority Habitat which makes up less than 1 % of the CHARWELTON STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an	Low

	important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following: 0 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 0 religious grounds, 0 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 0 cemeteries. Also within the catchment are 0 areas where vulnerable population groups would be expected. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CHARWELTON STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 3 statutory rivers / unnamed water bodies. Water environment features intersected include: River Cherwell, Watercourses , Watercourses River Cherwell From Charwelton To Above Banbury, Flood Warning Areas River Cherwell From Charwelton To Just Above Upper Heyford, Flood Alert Areas Of the total area of the catchment, 13 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a As a whole 100 % of CHARWELTON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows: Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of CHARWELTON STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 0 no. sensitive receptors. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 0 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 0 religious grounds, 0 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 0 sensitive receptors (School and education centres, hospitals or residential care homes)	Low

1.76. CHESHAM STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 1 Locally designated sites (LNR) Captain'S Wood, Local Nature Reserve Within 10km there are 1 no. SPAs, SACs and/or Ramsar sites Chilterns Beechwoods, Special Area of Conservation (SAC) Within 2km there are 4 no. SSSI and/or NNR sites Dancersend Waterworks, Site of Special Scientific Interest Dancersend, Site of Special Scientific Interest Frogmore Meadows, Site of Special Scientific Interest Tring Woodlands, Site of Special Scientific Interest As a whole less than 1% of CHESHAM STW catchment, is designated either at an International, National or Local level.	Medium

	Intersects 242 areas of Priority Habitat which makes up 6 % of the CHESHAM STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 80 areas currently utilised for recreation or which benefit the community. This includes 13 allotments, 13 religious grounds, 19 playing fields, 4 sports facility, 4 golf courses, 10 public parks and 2 cemeteries. Also within the catchment are 15 areas where vulnerable population groups would be expected. This includes 15 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 6 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CHESHAM STW catchment 58% is classified as urban.	Medium
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 3 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 9 statutory rivers / unnamed water bodies. Water environment features intersected include: River Chess, Watercourses River Chess At Chenies, Flood Warning Areas River Chess At Chesham, Flood Warning Areas River Chess In The Chilterns And Three Rivers Districts, Flood Alert Areas Groundwater Flooding In Chesham, Flood Alert Areas Of the total area of the catchment, 4 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	High
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Grade 2, Soil grades 2 and 3a Urban, Urban Land As a whole 95 % of CHESHAM STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 1 no. areas designated as Air Quality Management Area as follows: Chesham Aqma, AQMA AQMAs constitute less than 1 % area of CHESHAM STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar)	Medium

	Intersects 15 no. sensitive receptors. This includes 15 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 54 no areas utilised for recreation or which benefit the community. This includes 13 Allotments, 11 religious grounds, 12 playing fields, 3 sports facility, 3 golf course, 10 public park and 2 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 39 sensitive receptors (School and education centres, hospitals or residential care homes) Hawridge And Cholesbury Church Of England School, Schools and Education centres Our Lady'S Roman Catholic Primary School, Schools and Education centres Chesham Bois Church Of England Combined School, Schools and Education centres Elangeni School, Schools and Education centres Chestnut Lane School, Schools and Education centres Chartridge Combined School, Schools and Education centres Ivingswood Academy, Schools and Education centres Brushwood Junior School, Schools and Education centres Newtown Infant School And Nursery, Schools and Education centres Elmtree School And Nursery, Schools and Education centres Ley Hill School, Schools and Education centres Waterside Primary Academy, Schools and Education centres Thomas Harding Junior School, Schools and Education centres Bovingdon Primary Academy, Schools and Education centres None, Allotments Amersham Road Allotments, Allotments Church Of St Mary Magdalene, Religious grounds St Leonard'S Church, Religious grounds St Lawrence'S Church, Religious grounds St Michael'S Church, Religious grounds St Mary'S Church, Religious grounds St Columba'S Church, Religious grounds Chesham Methodist Church, Religious grounds St George'S Church, Religious grounds Chesham Bois Roman Catholic Church, Religious grounds None, Playing fields Hyde Lane Play Area, Playing fields None, Sports facility Chess Vale Bowling Club, Sports facility None, Golf course None, Public park Cholesbury Common, Public park Meades Water Gardens, Public park Lowndes Park, Public park Bovingdon Green, Public park Chesham Moor, Public park Co-Op Field, Public park None, Cemeteries Chesham Bois Burial Ground, Cemeteries	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 11 Communities at Risk Areas (flooding) Contains 2 Flood Warning Areas Contains 2 Flood Alert Areas	High
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 244 Listed Buildings Intersects 3 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing	High

	pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty Chilterns, Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 21 % of CHESHAM STW catchment is designated either AONB or National Park.	

1.77. CHIEVELEY STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 3 no. SPAs, SACs and/or Ramsar sites River Lambourn, Special Area of Conservation (SAC) Kennet & Lambourn Floodplain, Special Area of Conservation (SAC) Kennet Valley Alderwoods, Special Area of Conservation (SAC) Within 2km there are 3 no. SSSI and/or NNR sites Cold Ash Quarry, Site of Special Scientific Interest Ashridge Wood, Site of Special Scientific Interest Snelsmore Common, Site of Special Scientific Interest As a whole 0% of CHIEVELEY STW catchment, is designated either at an International, National or Local level. Intersects 65 areas of Priority Habitat which makes up 4 % of the CHIEVELEY STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 19 areas currently utilised for recreation or which benefit the community. This includes 1 allotments, 5 religious grounds, 7 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 2 cemeteries. Also within the catchment are 4 areas where vulnerable population groups would be expected. This includes 4 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 3 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CHIEVELEY STW catchment 10% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There	Medium

	are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 3 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses River Lambourn And Its Tributaries From Upper Lambourn Down To Newbury, Flood Alert Areas Of the total area of the catchment, less than 1 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a As a whole 94 % of CHIEVELEY STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of CHIEVELEY STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 3 no. sensitive receptors. This includes 3 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 9 no areas utilised for recreation or which benefit the community. This includes 1 Allotments, 3 religious grounds, 4 playing fields, 0 sports facility, 0 golf course, 0 public park and 1 cemeteries Within 200 meters, there are 1 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Cold Ash Quarry, Site of Special Scientific Interest Within 200 meters, there are 10 sensitive receptors (School and education centres, hospitals or residential care homes) Hermitage Primary School, Schools and Education centres Chieveley Primary School, Schools and Education centres Beedon C Of E Primary School, Schools and Education centres None, Allotments St Mary'S Church, Religious grounds Holy Trinity Church, Religious grounds St Barnabas' Church, Religious grounds None, Playing fields Pinewood Playground, Playing fields None, Cemeteries	Medium

Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 4 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses River Evenlode From Moreton In Marsh To Cassington And Also The River Glyme At Wootton And Woodstock, Flood Alert Areas Of the total area of the catchment, less than 1 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a Grade 2, Soil grades 2 and 3a As a whole 98 % of CHIPPING NORTON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences	Medium

	for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 1 no. areas designated as Air Quality Management Area as follows: Chipping Norton Aqma, AQMA AQMA's constitute less than 1 % area of CHIPPING NORTON STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 4 no. sensitive receptors. This includes 3 Schools and education centres, 1 hospitals, and 0 residential care homes Intersects 18 no areas utilised for recreation or which benefit the community. This includes 2 Allotments, 6 religious grounds, 8 playing fields, 0 sports facility, 0 golf course, 2 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 13 sensitive receptors (School and education centres, hospitals or residential care homes) Holy Trinity Roman Catholic School, Schools and Education centres Kingham Primary School, Schools and Education centres St Mary'S Church Of England (Aided) Primary School, Schools and Education centres None, Hospitals None, Allotments St Andrew'S Church, Religious grounds St Mary'S Church, Religious grounds Holy Trinity Roman Catholic Church, Religious grounds None, Religious grounds All Saints' Church, Religious grounds None, Playing fields The Green, Public park None, Cemeteries	
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 3 Communities at Risk Areas (flooding) Contains 0 Flood Warning Areas Contains 11 Flood Alert Areas	Medium
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 216 Listed Buildings Intersects 4 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Medium
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty Cotswolds, Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 94 % of CHIPPING NORTON STW catchment is designated either AONB or National Park.	High

1.82. CHIPPING WARDEN STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 1 no. SSSI and/or NNR sites Glyme Valley, Site of Special Scientific Interest As a whole 0% of CHIPPING WARDEN STW catchment, is designated either at an International, National or Local level. Intersects 15 areas of Priority Habitat which makes up 3 % of the CHIPPING WARDEN STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 10 areas currently utilised for recreation or which benefit the community. This includes 4 allotments, 3 religious grounds, 1 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 0 cemeteries. Also within the catchment are 2 areas where vulnerable population groups would be expected. This includes 2 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	Medium
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CHIPPING WARDEN STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 3 Drinking Water Safeguard Zones Intersects 0 statutory rivers / unnamed water bodies. Water environment features intersected include: River Cherwell From Charwelton To Above Banbury, Flood Warning Areas River Cherwell From Charwelton To Just Above Upper Heyford, Flood Alert Areas Of the total area of the catchment, less than 1 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and	Medium

	operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a As a whole 100 % of CHIPPING WARDEN STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of CHIPPING WARDEN STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 1 no. sensitive receptors. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 6 no areas utilised for recreation or which benefit the community. This includes 3 Allotments, 2 religious grounds, 1 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 7 sensitive receptors (School and education centres, hospitals or residential care homes) Chipping Warden School, Schools and Education centres Holy Trinity Roman Catholic School, Schools and Education centres None, Allotments St Peter And St Paul'S Church, Religious grounds St Mary Magdalen'S Church, Religious grounds Holy Trinity Roman Catholic Church, Religious grounds None, Playing fields	Medium
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 3 Communities at Risk Areas (flooding) Contains 5 Flood Warning Areas Contains 13 Flood Alert Areas	High
Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 1 areas designated as Area of Outstanding Natural Beauty Cotswolds, Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole less than 1 % of CHURCH HANBOROUGH STW catchment is designated either AONB or National Park.	High

1.86. CIRENCESTER STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 2 Nationally designated sites (SSSI and NNR) Kemble Railway Cuttings, Site of Special Scientific Interest Cotswold Water Park, Site of Special Scientific Interest Intersects 1 Locally designated sites (LNR) City Bank, Local Nature Reserve Within 10km there are 2 no. SPAs, SACs and/or Ramsar sites North Meadow & Clattinger Farm, Special Area of Conservation (SAC) Cotswold Beechwoods, Special Area of Conservation (SAC) Within 2km there are 8 no. SSSI and/or NNR sites Kemble Railway Cuttings, Site of Special Scientific Interest Cotswold Water Park, Site of Special Scientific Interest Wildmoorway Meadows, Site of Special Scientific Interest Clattinger Farm, Site of Special Scientific Interest Pike Corner, Site of Special Scientific Interest	High

	Acres Farm Meadow, Site of Special Scientific Interest Upper Waterhay Meadow, Site of Special Scientific Interest Elmlea Meadows, Site of Special Scientific Interest As a whole less than 1% of CIRENCESTER STW catchment, is designated either at an International, National or Local level. Intersects 145 areas of Priority Habitat which makes up 3 % of the CIRENCESTER STW catchment area.	
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 95 areas currently utilised for recreation or which benefit the community. This includes 23 allotments, 12 religious grounds, 27 playing fields, 1 sports facility, 2 golf courses, 14 public parks and 5 cemeteries. Also within the catchment are 11 areas where vulnerable population groups would be expected. This includes 10 Schools and education centres, 1 hospitals, and 0 residential care homes. This is also reflected in the designation of 6 no. Noise Important Areas within the catchment.	High
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CIRENCESTER STW catchment 52% is classified as urban.	Medium
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 2 areas of Source Protections Zones 1 and 2 Intersects 1 Drinking Water Safeguard Zones Intersects 17 statutory rivers / unnamed water bodies. Water environment features intersected include: , Watercourses River Churn, Watercourses River Thames, Watercourses Daglingworth Stream, Watercourses River Churn At South Cerney, Flood Warning Areas River Thames From Somerford Keynes To Cricklade, Flood Warning Areas River Churn At Cerney Wick, Flood Warning Areas River Churn From Baunton To Siddington Including Cirencester, Flood Warning Areas River Thames At Ewen, Flood Warning Areas River Churn And Its Tributaries, Flood Alert Areas River Thames From Ewen Down To And Including Cricklade, Flood Alert Areas Of the total area of the catchment, 14 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	High
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 2, Soil grades 2 and 3a Grade 3, Soil grades 2 and 3a Urban, Urban Land As a whole 92 % of CIRENCESTER STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium

Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMAs constitute 0 % area of CIRENCESTER STW catchment. Intersects 12 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 10 no. sensitive receptors. This includes 9 Schools and education centres, 1 hospitals, and 0 residential care homes Intersects 60 no areas utilised for recreation or which benefit the community. This includes 20 Allotments, 10 religious grounds, 15 playing fields, 1 sports facility, 0 golf course, 10 public park and 4 cemeteries Within 200 meters, there are 3 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) <table><tr><td>Kemble Railway Cuttings, Site of Special Scientific Interest</td><td>Powell'S Church Of England Primary School, Schools and Education centres Stratton</td></tr><tr><td>Cotswold Water Park, Site of Special Scientific Interest</td><td>Church Of England Primary School, Schools and Education centres Watermoor C Of E</td></tr><tr><td>Wildmoorway Meadows, Site of Special Scientific Interest</td><td>Primary School, Schools and Education centres</td></tr><tr><td>Within 200 meters, there are 26 sensitive receptors (School and education centres, hospitals or residential care homes)</td><td>Cirencester Hospital, Hospitals</td></tr><tr><td>Kemble Primary School, Schools and Education centres</td><td>None, Allotments</td></tr><tr><td>North Cerney Primary School, Schools and Education centres</td><td>All Hallows' Church, Religious grounds</td></tr><tr><td>Ann Edwards Church Of England Primary School, Schools and Education centres</td><td>St Peter'S Church, Religious grounds</td></tr><tr><td>Siddington Church Of England Primary School, Schools and Education centres</td><td>St Lawrence'S Church, Religious grounds</td></tr><tr><td>Watermoor Church Of England Primary School, Schools and Education centres</td><td>All Saints' Church, Religious grounds</td></tr><tr><td>Cirencester Primary School, Schools and Education centres</td><td>St John The Baptist'S Church, Religious grounds</td></tr><tr><td>Chesterton Primary School, Schools and Education centres</td><td>St Mary Magdalene'S Church, Religious grounds</td></tr><tr><td></td><td>Trinity Church, Religious grounds</td></tr><tr><td></td><td>None, Playing fields</td></tr><tr><td></td><td>None, Sports facility</td></tr><tr><td></td><td>Cirencester Golf Course, Golf course</td></tr><tr><td></td><td>None, Public park</td></tr><tr><td></td><td>Home Park, Public park</td></tr><tr><td></td><td>Neigh Bridge, Public park</td></tr><tr><td></td><td>None, Cemeteries</td></tr></table>	Kemble Railway Cuttings, Site of Special Scientific Interest	Powell'S Church Of England Primary School, Schools and Education centres Stratton	Cotswold Water Park, Site of Special Scientific Interest	Church Of England Primary School, Schools and Education centres Watermoor C Of E	Wildmoorway Meadows, Site of Special Scientific Interest	Primary School, Schools and Education centres	Within 200 meters, there are 26 sensitive receptors (School and education centres, hospitals or residential care homes)	Cirencester Hospital, Hospitals	Kemble Primary School, Schools and Education centres	None, Allotments	North Cerney Primary School, Schools and Education centres	All Hallows' Church, Religious grounds	Ann Edwards Church Of England Primary School, Schools and Education centres	St Peter'S Church, Religious grounds	Siddington Church Of England Primary School, Schools and Education centres	St Lawrence'S Church, Religious grounds	Watermoor Church Of England Primary School, Schools and Education centres	All Saints' Church, Religious grounds	Cirencester Primary School, Schools and Education centres	St John The Baptist'S Church, Religious grounds	Chesterton Primary School, Schools and Education centres	St Mary Magdalene'S Church, Religious grounds		Trinity Church, Religious grounds		None, Playing fields		None, Sports facility		Cirencester Golf Course, Golf course		None, Public park		Home Park, Public park		Neigh Bridge, Public park		None, Cemeteries	Medium

1.90. CLIFTON STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 0 no. SPAs, SACs and/or Ramsar sites Within 2km there are 1 no. SSSI and/or NNR sites Bestmoor, Site of Special Scientific Interest As a whole 0% of CLIFTON STW catchment, is designated either at an International, National or Local level. Intersects 4 areas of Priority Habitat which makes up less than 1 % of the CLIFTON STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 1 areas currently utilised for recreation or which benefit the community. This includes 0 allotments, 0 religious grounds, 1 playing fields, 0 sports facility, 0 golf courses, 0 public parks and 0 cemeteries.	Medium

	Also within the catchment are 0 areas where vulnerable population groups would be expected. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of CLIFTON STW catchment 0% is classified as urban.	Low
Water	Development related pollutants pose considerable risks to quality of water. Additional water demand from development will put further pressure on water resources. There are considerable pressures on water resources with resulting major impacts on many of the waterbodies across the UK. Water Quality and Flood Risk within this catchment is characterised by the following: Intersects 0 areas of Source Protections Zones 1 and 2 Intersects 2 Drinking Water Safeguard Zones Intersects 0 statutory rivers / unnamed water bodies. Water environment features intersected include: River Cherwell From Below Banbury To Just Above Upper Heyford, Flood Warning Areas River Cherwell From Charwelton To Just Above Upper Heyford, Flood Alert Areas Of the total area of the catchment, less than 1 % is covered by flood risk zones 2 or 3 and is therefore at elevated level of flood risk.	Medium
Soil	Measures should be taken to avoid those areas of the highest quality agricultural soils and aim to protect soil and agricultural holdings through avoidance of impacts such as contamination or severance which might be expected through construction and operation of new infrastructure. Grades 1-3a are classed as the best and most versatile land. The catchment intersects the following Agricultural Land Classification Grades: Grade 3, Soil grades 2 and 3a As a whole 66 % of CLIFTON STW catchment is classified as either Grades 1, 2 or 3 and therefore more likely to fall under a classification of Best and Most Versatile Land.	Medium
Air	Air quality has improved in the UK over the last sixty years as a result of the switch from coal to gas and electricity for heating of domestic and industrial premises, stricter controls on industrial emissions, higher standards for the composition of fuel and tighter regulations on emissions from motor vehicles. Construction practices in particular have the potential to increase pressure on air quality locally with knock on consequences for vulnerable population groups and biodiversity. The catchment is characterised as follows; Intersects 0 no. areas designated as Air Quality Management Area as follows: AQMA's constitute 0 % area of CLIFTON STW catchment. Intersects 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Intersects 0 no. sensitive receptors. This includes 0 Schools and education centres, 0 hospitals, and 0 residential care homes Intersects 1 no areas utilised for recreation or which benefit the community. This includes 0 Allotments, 0 religious grounds, 1 playing fields, 0 sports facility, 0 golf course, 0 public park and 0 cemeteries Within 200 meters, there are 0 Nature Conservation sites (SAC, SPA, SSSI, NNR or Ramsar) Within 200 meters, there are 1 sensitive receptors (School and education centres, hospitals or residential care homes) None, Playing fields	Medium
Climate factors	Climate change represents a considerable and growing challenge for the UK which is more frequently associated with increased flood risk. The UK also anticipate hotter, drier summers; warmer, wetter winters; and rising sea levels. The catchment is characterised as follows: Intersects 0 Communities at Risk Areas (flooding) Contains 8 Flood Warning Areas Contains 13 Flood Alert Areas	Medium

Cultural heritage	There is a substantial cultural heritage resource across England; however, there is considerable variation in the condition and integrity of assets and are at risk from infrastructure development where not sensitively considered. Those cultural heritage assets of the greatest recognition in England are World Heritage Sites. These sites are recognised as having Outstanding Universal Value. The World Heritage Sites and other cultural heritage designations in relation to this catchment are outlined below; Intersects 0 World Heritage Sites Intersects 5 Listed Buildings Intersects 0 areas designated as Scheduled Monuments Intersects 0 areas designated as Registered parks and gardens Intersects 0 areas designated as Registered Battlefields Within 500 meters, there are 0 World Heritage Sites	Low
Landscape	There are marked contrasts in the quality, character and distinctiveness of landscapes across England. There is a need to fully protect the highest quality locations, whilst integrating best practice principles through all infrastructure development in addressing pressures on landscape environments. In this catchment the following landscape designations have been considered; Intersects 0 areas designated as Area of Outstanding Natural Beauty Intersects 0 areas designated as National Park As a whole 0 % of CLIFTON STW catchment is designated either AONB or National Park.	Low

1.91. COMBE STW Catchment

SEA Topic	Commentary	Sensitivity assigned
Biodiversity	Infrastructure works can put pressure on sites designated for nature conservation and wider green infrastructure, particularly through construction impacts. Wider green infrastructure can however benefit from opportunities to deliver Biodiversity Net Gain through new development. Across England, there are sites internationally (SACs, SPAs, Ramsar sites) and nationally (e.g. SSSIs) designated for nature conservation. A breakdown of the sites designated for biodiversity within the wastewater catchment are as below; Intersects 0 Internationally designated sites (SPA, SAC, Ramsar) Intersects 0 Nationally designated sites (SSSI and NNR) Intersects 0 Locally designated sites (LNR) Within 10km there are 1 no. SPAs, SACs and/or Ramsar sites Oxford Meadows, Special Area of Conservation (SAC) Within 2km there are 7 no. SSSI and/or NNR sites Sturt Copse, Site of Special Scientific Interest Stonesfield Common, Bottoms & Banks, Site of Special Scientific Interest Blenheim Park, Site of Special Scientific Interest Whitehill Wood, Site of Special Scientific Interest Long Hanborough Gravel Pit, Site of Special Scientific Interest Holly Court Bank, Site of Special Scientific Interest Stonesfield Slate Mines, Site of Special Scientific Interest As a whole 0% of COMBE STW catchment, is designated either at an International, National or Local level. Intersects 8 areas of Priority Habitat which makes up less than 1 % of the COMBE STW catchment area.	Medium
Population and Human health	England has a growing population, with a general underlying trend towards an ageing population, though there are areas with younger population profiles. These demographic characteristics contribute to a complex pattern of highly-contrasting communities, with differing requirements for economic and social infrastructure. There is a role for the environment in enabling people to feel connected to place; and growing evidence that physical activity and access to nature and opportunities for community interaction is an	Medium

	important contributor to mental health and well-being. Sensitive receptors within the catchment have been identified and include the following; 4 areas currently utilised for recreation or which benefit the community. This includes 1 allotments, 1 religious grounds, 0 playing fields, 0 sports facility, 0 golf courses, 1 public parks and 0 cemeteries. Also within the catchment are 1 areas where vulnerable population groups would be expected. This includes 1 Schools and education centres, 0 hospitals, and 0 residential care homes. This is also reflected in the designation of 0 no. Noise Important Areas within the catchment.	
Material Assets	By their nature, wastewater catchments are anticipated to be relatively developed and contain a range of material assets. A high level characterisation of the extent to which material assets exist within a catchment is provided through understanding of the level of urbanisation within it. In respect of COMBE STW catchment 0% is classified as urban.	Low
